

Recommendations to Improve Rural Sanitation

Respected Your Highness

Thank you for providing this opportunity for strengthening the Swachh Bharat Mission (Rural). The attached proposal presents practical recommendations to improve rural sanitation, waste management, water conservation, and environmental protection.

Segregation of the edible birds, animal remains from the mixed garbage and it is very dirtyful and there is a very infernal and disgusting or repugnant. Some people will simply stand and watch such things, take photos or videos, and upload them to social media, thereby exposing the ugly side of society.

However, a troubling trend is visible in this country: people do not abide by a rule unless it is enforced upon society, nor do they make any voluntary effort to follow it.

While the tradition of cremating human bodies exists in our society, practices are evolving; body donation is taking place, and diesel or electric crematoriums are being used for cremation. In fact, performing last rites using electric crematoriums is increasingly being adopted within the community.

It is obviously ruled that every Gram Panchayat or the Nagar Panchayat or Municipal Council or the Municipal Corporation as a capable, accountable and financially sustainable sanitation service provider. But it is also important to note that every though the Government Undertaking organizations are having their responsibilities to do needful regarding sanitation but also it is duty of the every citizen to take efforts to

keep clean by way of neatly sorting it but also, especially the butcher are having their most important responsibility to destroy or dispose off their bio-waste comes through their own business.

It is also very important to note while constructing the roads at every place to be a best slop by which, it will not be need to clean the roads in rainy season and the said water will be flooded through gutter beside it.

As such, it is very difficult to remove interventions like partial wastewater bio-waste like animal bodies or the waste released from the butchers i.e. hens, goats etc. from polluted nallahs or small water trenches or instream passing through the villages or any city.

As a result, a foul stench spreads through the atmosphere, and consequently, society has to contend with disease. It is very disgusting/hateful to everyone but also especially to the vegetarians.

It is the not only difficult for Rural people/citizen but also for the citizen of Urban areas. Especially, it seen in the Rural area in large. When it is in large in the urban areas water trenches the said bio waste of animal bodies, it flooded through the rural areas vicinity and spread the smell or hazardous in the respective urban or rural areas.

Hence, it is necessary to have a permanent solution for the disposal of the said hazardous of said bio waste of animal bodies at the initial stage. Especially the butcher (Hens, goats or etc.) are having their most important responsibility to destroy or dispose off their bio-waste comes through their own business shall not throw in the abandoned places or anywhere. So that there is necessity of permanent disposal facility to destroy same. Therefore, it is very essential to install the Electric crematorium (विजदाहिनी) so that there will no garbage in the environment and nothing question of of bad smell or hazardousness to the society and it will be keep away from spreading any type diseases.

So it is humbly requested and submitted with respect that in every 5 to 7 kilometers square area or where the Mutton Markets or slaughtering markets are available where, there will have to be installation of such type of Electric Crematorium for the disposal of Edible or any type of Bio Waste of animal bodies at the initial stage or shall have to be installed. Thereby the environment may be clean and healthy and will not any outbreak will not occur.

Submitted with all respects.

Yours faithfully,

Nitin K. Vispute,
Nashik
