      requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                                   iterator_t<maybe-const<OtherConst, Views>>> && ...)
    friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
      operator-(const sentinel& y, const iterator<OtherConst>& x);
  };
}

constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);
```

1 *Effects*: Initializes *end_* with end.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);
```

2 *Effects*: Initializes *end_* with `std::move(i.end_)`.

```
template<bool OtherConst>
  requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                         iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Returns*: `true` if there exists an integer $0 \leq i <$ `sizeof...(Views)` such that `bool(std::get<i>(x.current_) == std::get<i>(y.end_))` is `true`. Otherwise, `false`.

```
template<bool OtherConst>
  requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                               iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 Let `D` be the return type. Let *DIST*(*i*) be `D(std::get<`*i*`>(x.`*current_*`) - std::get<`*i*`>(y.`*end_*`))`.

5 *Returns*: The value with the smallest absolute value among *DIST*(*n*) for all integers $0 \leq n <$ `sizeof...(Views)`.

```
template<bool OtherConst>
  requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                               iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
  operator-(const sentinel& y, const iterator<OtherConst>& x);
```

6 *Effects*: Equivalent to: `return -(x - y);`

25.7.26 Zip transform view [range.zip.transform]

25.7.26.1 Overview [range.zip.transform.overview]

1 `zip_transform_view` takes an invocable object and any number of views and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} elements of all views.

2 The name `views::zip_transform` denotes a customization point object (16.3.3.3.5). Let `F` be a subexpression, and let `Es...` be a pack of subexpressions.

(2.1) — If `Es` is an empty pack, let `FD` be `decay_t<decltype((F))>`.

(2.1.1) — If `move_constructible<FD> && regular_invocable<FD&>` is `false`, or if `decay_t<invoke_result_t<FD&>>` is not an object type, `views::zip_transform(F, Es...)` is ill-formed.

(2.1.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to

```
((void)F, auto(views::empty<decay_t<invoke_result_t<FD&>>>))
```

(2.2) — Otherwise, the expression `views::zip_transform(F, Es...)` is expression-equivalent to `zip_transform_view(F, Es...)`.

3 [*Example 1*:

```
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip_transform(plus(), v1, v2)) {
  cout << i << ' ';     // prints 5 7
}
```

— *end example*]

25.7.26.2 Class template zip_transform_view [range.zip.transform.view]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  class zip_transform_view : public view_interface<zip_transform_view<F, Views...>> {
    movable-box<F> fun_;                    // exposition only

    constexpr auto size() const requires sized_range<const InnerView> {
      return zip_.size();
    }
  };

  template<class F, class... Rs>
    zip_transform_view(F, Rs&&...) -> zip_transform_view<F, views::all_t<Rs>...>;
}

constexpr explicit zip_transform_view(F fun, Views... views);
```

1 *Effects*: Initializes *fun_* with `std::move(fun)` and *zip_* with `std::move(views)`....

25.7.26.3 Class template `zip_transform_view::iterator` [range.zip.transform.iterator]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  template<bool Const>
  class zip_transform_view<F, Views...>::iterator {
    using Parent = maybe-const<Const, zip_transform_view>;      // exposition only
    using Base = maybe-const<Const, InnerView>;                 // exposition only
    Parent* parent_ = nullptr;                                  // exposition only
    ziperator<Const> inner_;                                    // exposition only
```

```
    constexpr iterator(Parent& parent, ziperator<Const> inner);   // exposition only

  public:
    using iterator_category = see below;                          // not always present
    using iterator_concept  = ziperator<Const>::iterator_concept;
    using value_type =
      remove_cvref_t<invoke_result_t<maybe-const<Const, F>&,
                                     range_reference_t<maybe-const<Const, Views>>...>>;
    using difference_type = range_difference_t<Base>;

    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<ziperator<false>, ziperator<Const>>;

    constexpr decltype(auto) operator*() const noexcept(see below);
    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<Base>;

    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;

    constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

    constexpr decltype(auto) operator[](difference_type n) const
      requires random_access_range<Base>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<ziperator<Const>>;

    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires random_access_range<Base>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;
  };
}
```

1 The member *typedef-name* `iterator::iterator_category` is declared if and only if `Base` models `forward_range`. In that case, `iterator::iterator_category` is defined as follows:

(1.1) — If

`invoke_result_t<maybe-const<Const, F>&, range_reference_t<maybe-const<Const, Views>>...>`

is not a reference, `iterator_category` denotes `input_iterator_tag`.

(1.2) — Otherwise, let `Cs` denote the pack of types `iterator_traits<iterator_t<maybe-const<Const, Views>>>::iterator_category...`.

(1.2.1) — If `(derived_from<Cs, random_access_iterator_tag> && ...)` is `true`, `iterator_category` denotes `random_access_iterator_tag`.

(1.2.2) — Otherwise, if `(derived_from<Cs, bidirectional_iterator_tag> && ...)` is `true`, `iterator_category` denotes `bidirectional_iterator_tag`.

(1.2.3) — Otherwise, if `(derived_from<Cs, forward_iterator_tag> && ...)` is `true`, `iterator_category` denotes `forward_iterator_tag`.

(1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, ziperator<Const> inner);
```

2 *Effects*: Initializes *parent_* with `addressof(parent)` and *inner_* with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<ziperator<false>, ziperator<Const>>;
```

3 *Effects*: Initializes *parent_* with `i.`*parent_* and *inner_* with `std::move(i.`*inner_*`)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

4 *Effects*: Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

5 *Remarks*: Let `Is` be the pack `0, 1, ..., (sizeof...(Views) - 1)`. The exception specification is equivalent to: `noexcept(invoke(*`*parent_*`->`*fun_*`, *std::get<Is>(`*inner_.current_*`)...))`.

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++inner_;
return *this;
```

```
constexpr void operator++(int);
```

7 *Effects*: Equivalent to: `++*this`.

```
constexpr iterator operator++(int) requires forward_range<Base>;
```

8 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

9 *Effects*: Equivalent to:

```
--inner_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;
```

11 *Effects*: Equivalent to:

```
inner_ += x;
return *this;
```

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

12 *Effects*: Equivalent to:

```
inner_ -= x;
return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
  requires random_access_range<Base>;
```

13 *Effects*: Equivalent to:

```
      return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
        return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
      }, inner_.current_);

friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<ziperator<Const>>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

14 Let *op* be the operator.

15 *Effects*: Equivalent to: `return x.inner_ op y.inner_;`

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

16 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ + n);`

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

17 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ - n);`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;
```

18 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.26.4 Class template zip_transform_view::*sentinel* [range.zip.transform.sentinel]

```
namespace std::ranges {
  template<move_constructible F, input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0) && is_object_v<F> &&
             regular_invocable<F&, range_reference_t<Views>...> &&
             can-reference<invoke_result_t<F&, range_reference_t<Views>...>>
  template<bool Const>
  class zip_transform_view<F, Views...>::sentinel {
    zentinel<Const> inner_;                                  // exposition only
    constexpr explicit sentinel(zentinel<Const> inner);      // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && convertible_to<zentinel<false>, zentinel<Const>>;

    template<bool OtherConst>
      requires sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const sentinel& x, const iterator<OtherConst>& y);
  };
}

constexpr explicit sentinel(zentinel<Const> inner);
```

1 *Effects*: Initializes *inner_* with inner.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<zentinel<false>, zentinel<Const>>;
```

2 *Effects*: Initializes *inner_* with `std::move(i.inner_)`.

```
template<bool OtherConst>
  requires sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.inner_ == y.inner_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
template<bool OtherConst>
  requires sized_sentinel_for<zentinel<Const>, ziperator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const sentinel& x, const iterator<OtherConst>& y);
```

4 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.27 Adjacent view [range.adjacent]

25.7.27.1 Overview [range.adjacent.overview]

1 `adjacent_view` takes a view and produces a view whose M^{th} element is a tuple of references to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::adjacent<N>` denotes a range adaptor object (25.7.2). Given a subexpression `E` and a constant expression `N`, the expression `views::adjacent<N>(E)` is expression-equivalent to

(2.1) — `((void)E, auto(views::empty<tuple<>>))` if `N` is equal to `0` and `decltype((E))` models `forward_range`,

(2.2) — otherwise, `adjacent_view<views::all_t<decltype((E))>, N>(E)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent<2>) {
  cout << "(" << std::get<0>(i) << ", " << std::get<1>(i) << ") ";  // prints (1, 2) (2, 3) (3, 4)
}
```

— *end example*]

3 Define *REPEAT*`(T, N)` as a pack of `N` types, each of which denotes the same type as `T`.

25.7.27.2 Class template `adjacent_view` [range.adjacent.view]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  class adjacent_view : public view_interface<adjacent_view<V, N>> {
    V base_ = V();                      // exposition only

    // 25.7.27.3, class template adjacent_view::iterator
    template<bool> class iterator;      // exposition only

    // 25.7.27.4, class template adjacent_view::sentinel
    template<bool> class sentinel;      // exposition only

    struct as-sentinel{};               // exposition only

  public:
    adjacent_view() requires default_initializable<V> = default;
    constexpr explicit adjacent_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }
```

```
    constexpr auto begin() requires (!simple-view<V>) {
      return iterator<false>(ranges::begin(base_), ranges::end(base_));
    }

    constexpr auto begin() const requires range<const V> {
      return iterator<true>(ranges::begin(base_), ranges::end(base_));
    }

    constexpr auto end() requires (!simple-view<V>) {
      if constexpr (common_range<V>) {
        return iterator<false>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<false>(ranges::end(base_));
      }
    }

    constexpr auto end() const requires range<const V> {
      if constexpr (common_range<const V>) {
        return iterator<true>(as-sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<true>(ranges::end(base_));
      }
    }

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };
}

constexpr explicit adjacent_view(V base);
```

1 *Effects*: Initializes *base_* with `std::move(base)`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

2 *Effects*: Equivalent to:

```
using ST = decltype(ranges::size(base_));
using CT = common_type_t<ST, size_t>;
auto sz = static_cast<CT>(ranges::size(base_));
sz -= std::min<CT>(sz, N - 1);
return static_cast<ST>(sz);
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

3 *Effects*: Equivalent to:

```
using DT = range_difference_t<decltype((base_))>;
using CT = common_type_t<DT, size_t>;
auto sz = static_cast<CT>(ranges::reserve_hint(base_));
sz -= std::min<CT>(sz, N - 1);
return to-unsigned-like(sz);
```

25.7.27.3 Class template `adjacent_view::iterator` [range.adjacent.iterator]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  template<bool Const>
  class adjacent_view<V, N>::iterator {
    using Base = maybe-const<Const, V>;                                  // exposition only
    array<iterator_t<Base>, N> current_ = array<iterator_t<Base>, N>();  // exposition only
    constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);   // exposition only
```

```
    constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
                                                                        // exposition only
  public:
    using iterator_category = input_iterator_tag;
    using iterator_concept  = see below;
    using value_type = tuple<REPEAT(range_value_t<Base>, N)...>;
    using difference_type = range_difference_t<Base>;

    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

    constexpr auto operator*() const;
    constexpr iterator& operator++();
    constexpr iterator operator++(int);

    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;

    constexpr iterator& operator+=(difference_type x)
      requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type x)
      requires random_access_range<Base>;

    constexpr auto operator[](difference_type n) const
      requires random_access_range<Base>;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator<=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base> &&
               three_way_comparable<iterator_t<Base>>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires random_access_range<Base>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

    friend constexpr auto iter_move(const iterator& i) noexcept(see below);
    friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
      requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *Base* models random_access_range, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *Base* models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, iterator_concept denotes forward_iterator_tag.

2 If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```
constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);
```

3 *Postconditions*: *current_*[0] == first is true, and for every integer $1 \leq i < \texttt{N}$, *current_*[i] == ranges::next(*current_*[i-1], 1, last) is true.

```
constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
```

4 *Postconditions*: If *Base* does not model bidirectional_range, each element of *current_* is equal to *last*. Otherwise, *current_*[N-1] == last is true, and for every integer $0 \leq i < (\texttt{N} - 1)$, *current_*[$i$] == ranges::prev(*current_*[i+1], 1, first) is true.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 *Effects*: Initializes each element of *current_* with the corresponding element of i.*current_* as an xvalue.

```
constexpr auto operator*() const;
```

6 *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

7 *Preconditions*: *current_*.back() is incrementable.

8 *Postconditions*: Each element of *current_* is equal to ranges::next(i), where i is the value of that element before the call.

9 *Returns*: *this.

```
constexpr iterator operator++(int);
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Preconditions*: *current_*.front() is decrementable.

12 *Postconditions*: Each element of *current_* is equal to ranges::prev(i), where i is the value of that element before the call.

13 *Returns*: *this.

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;
```

15 *Preconditions*: *current_*.back() + x has well-defined behavior.

16 *Postconditions*: Each element of *current_* is equal to i + x, where i is the value of that element before the call.

17 *Returns*: *this.

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

18 *Preconditions*: *current_*.front() - x has well-defined behavior.

19 *Postconditions*: Each element of *current_* is equal to `i - x`, where `i` is the value of that element before the call.

20 *Returns*: `*this`.

```
constexpr auto operator[](difference_type n) const
  requires random_access_range<Base>;
```

21 *Effects*: Equivalent to:

```
return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

22 *Returns*: `x.current_.back() == y.current_.back()`.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

23 *Returns*: `x.current_.back() < y.current_.back()`.

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

24 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

25 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

26 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> &&
           three_way_comparable<iterator_t<Base>>;
```

27 *Returns*: `x.current_.back() <=> y.current_.back()`.

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

28 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

29 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

30 *Effects*: Equivalent to: `return x.current_.back() - y.current_.back();`

```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
```

31 *Effects*: Equivalent to: `return tuple-transform(ranges::iter_move, i.current_);`

32 *Remarks*: The exception specification is equivalent to:

```
noexcept(ranges::iter_move(declval<const iterator_t<Base>&>())) &&
is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>
```

```
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires indirectly_swappable<iterator_t<Base>>;
```

33 *Preconditions*: None of the iterators in `l.current_` is equal to an iterator in `r.current_`.

34 *Effects*: For every integer $0 \le i < \texttt{N}$, performs `ranges::iter_swap(l.current_[i], r.current_[i])`.

35 *Remarks*: The exception specification is equivalent to:

```
noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))
```

25.7.27.4 Class template `adjacent_view::sentinel` [range.adjacent.sentinel]

```
namespace std::ranges {
  template<forward_range V, size_t N>
    requires view<V> && (N > 0)
  template<bool Const>
  class adjacent_view<V, N>::sentinel {
    using Base = maybe-const<Const, V>;                    // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>();            // exposition only
    constexpr explicit sentinel(sentinel_t<Base> end);     // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    template<bool OtherConst>
      requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
      operator-(const sentinel& y, const iterator<OtherConst>& x);
  };
}
```

```
constexpr explicit sentinel(sentinel_t<Base> end);
```

1 *Effects*: Initializes *end_* with end.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

2 *Effects*: Initializes *end_* with `std::move(i.end_)`.

```
template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.current_.back() == y.end_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);
```

4 *Effects*: Equivalent to: `return x.current_.back() - y.end_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
  operator-(const sentinel& y, const iterator<OtherConst>& x);
```

5 *Effects*: Equivalent to: `return y.end_ - x.current_.back();`

25.7.28 Adjacent transform view [range.adjacent.transform]

25.7.28.1 Overview [range.adjacent.transform.overview]

1 `adjacent_transform_view` takes an invocable object and a view and produces a view whose M^{th} element is the result of applying the invocable object to the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::adjacent_transform<N>` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F` and a constant expression `N`:

(2.1) — If `N` is equal to `0` and `decltype((E))` models `forward_range`, `views::adjacent_transform<N>(E, F)` is expression-equivalent to `((void)E, views::zip_transform(F))`, except that the evaluations of `E` and `F` are indeterminately sequenced.

(2.2) — Otherwise, the expression `views::adjacent_transform<N>(E, F)` is expression-equivalent to `adjacent_transform_view<views::all_t<decltype((E))>, decay_t<decltype((F))>, N>(E, F)`.

3 [*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
  cout << i << ' ';     // prints 2 6 12
}
```

— *end example*]

25.7.28.2 Class template `adjacent_transform_view` [range.adjacent.transform.view]

```
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
             regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
             can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
  class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
    movable-box<F> fun_;                          // exposition only
    adjacent_view<V, N> inner_;                   // exposition only

    using InnerView = adjacent_view<V, N>;        // exposition only
    template<bool Const>
      using inner-iterator = iterator_t<maybe-const<Const, InnerView>>;          // exposition only
    template<bool Const>
      using inner-sentinel = sentinel_t<maybe-const<Const, InnerView>>;          // exposition only

    // 25.7.28.3, class template adjacent_transform_view::iterator
    template<bool> class iterator;                // exposition only

    // 25.7.28.4, class template adjacent_transform_view::sentinel
    template<bool> class sentinel;                // exposition only

  public:
    adjacent_transform_view() = default;
    constexpr explicit adjacent_transform_view(V base, F fun);

    constexpr V base() const & requires copy_constructible<V> { return inner_.base(); }
    constexpr V base() && { return std::move(inner_).base(); }

    constexpr auto begin() {
      return iterator<false>(*this, inner_.begin());
    }

    constexpr auto begin() const
      requires range<const InnerView> &&
               regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
      return iterator<true>(*this, inner_.begin());
    }
```

```
    constexpr auto end() {
      if constexpr (common_range<InnerView>) {
        return iterator<false>(*this, inner_.end());
      } else {
        return sentinel<false>(inner_.end());
      }
    }

    constexpr auto end() const
      requires range<const InnerView> &&
               regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
      if constexpr (common_range<const InnerView>) {
        return iterator<true>(*this, inner_.end());
      } else {
        return sentinel<true>(inner_.end());
      }
    }

    constexpr auto size() requires sized_range<InnerView> {
      return inner_.size();
    }

    constexpr auto size() const requires sized_range<const InnerView> {
      return inner_.size();
    }

    constexpr auto reserve_hint() requires approximately_sized_range<InnerView> {
      return inner_.reserve_hint();
    }

    constexpr auto reserve_hint() const requires approximately_sized_range<const InnerView> {
      return inner_.reserve_hint();
    }
  };
}

constexpr explicit adjacent_transform_view(V base, F fun);
```

1 *Effects*: Initializes *fun_* with `std::move(fun)` and *inner_* with `std::move(base)`.

25.7.28.3 Class template `adjacent_transform_view::iterator` [range.adjacent.transform.iterator]

```
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
             regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
             can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
  template<bool Const>
  class adjacent_transform_view<V, F, N>::iterator {
    using Parent = maybe-const<Const, adjacent_transform_view>;          // exposition only
    using Base = maybe-const<Const, V>;                                  // exposition only
    Parent* parent_ = nullptr;                                           // exposition only
    inner-iterator<Const> inner_;                                        // exposition only

    constexpr iterator(Parent& parent, inner-iterator<Const> inner);     // exposition only

  public:
    using iterator_category = see below;
    using iterator_concept  = inner-iterator<Const>::iterator_concept;
    using value_type =
      remove_cvref_t<invoke_result_t<maybe-const<Const, F>&,
                                     REPEAT(range_reference_t<Base>, N)...>>;
    using difference_type = range_difference_t<Base>;
```

```
    iterator() = default;
    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<inner-iterator<false>, inner-iterator<Const>>;

    constexpr decltype(auto) operator*() const noexcept(see below);
    constexpr iterator& operator++();
    constexpr iterator operator++(int);
    constexpr iterator& operator--() requires bidirectional_range<Base>;
    constexpr iterator operator--(int) requires bidirectional_range<Base>;
    constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
    constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

    constexpr decltype(auto) operator[](difference_type n) const
      requires random_access_range<Base>;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator<=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr bool operator>=(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
    friend constexpr auto operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base> && three_way_comparable<inner-iterator<Const>>;

    friend constexpr iterator operator+(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr iterator operator+(difference_type n, const iterator& i)
      requires random_access_range<Base>;
    friend constexpr iterator operator-(const iterator& i, difference_type n)
      requires random_access_range<Base>;
    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<inner-iterator<Const>, inner-iterator<Const>>;
  };
}
```

1 The member *typedef-name* `iterator::iterator_category` is defined as follows:

(1.1) — If `invoke_result_t<`*maybe-const*`<Const, F>&, `*REPEAT*`(range_reference_t<`*Base*`>, N)...>` is not a reference, `iterator_category` denotes `input_iterator_tag`.

(1.2) — Otherwise, let `C` denote the type `iterator_traits<iterator_t<`*Base*`>>::iterator_category`.

(1.2.1) — If `derived_from<C, random_access_iterator_tag>` is `true`, `iterator_category` denotes `random_access_iterator_tag`.

(1.2.2) — Otherwise, if `derived_from<C, bidirectional_iterator_tag>` is `true`, `iterator_category` denotes `bidirectional_iterator_tag`.

(1.2.3) — Otherwise, if `derived_from<C, forward_iterator_tag>` is `true`, `iterator_category` denotes `forward_iterator_tag`.

(1.2.4) — Otherwise, `iterator_category` denotes `input_iterator_tag`.

```
constexpr iterator(Parent& parent, inner-iterator<Const> inner);
```

2 *Effects*: Initializes *parent_* with `addressof(parent)` and *inner_* with `std::move(inner)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<inner-iterator<false>, inner-iterator<Const>>;
```

3 *Effects*: Initializes *parent_* with `i.`*parent_* and *inner_* with `std::move(i.`*inner_*`)`.

```
constexpr decltype(auto) operator*() const noexcept(see below);
```

4 *Effects*: Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, *iters...);
}, inner_.current_);
```

5 *Remarks*: Let `Is` be the pack `0, 1, ..., (N - 1)`. The exception specification is equivalent to:

```
noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...))
```

```
constexpr iterator& operator++();
```

6 *Effects*: Equivalent to:

```
++inner_;
return *this;
```

```
constexpr iterator operator++(int);
```

7 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

8 *Effects*: Equivalent to:

```
--inner_;
return *this;
```

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

9 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
```

10 *Effects*: Equivalent to:

```
inner_ += x;
return *this;
```

```
constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;
```

11 *Effects*: Equivalent to:

```
inner_ -= x;
return *this;
```

```
constexpr decltype(auto) operator[](difference_type n) const
  requires random_access_range<Base>;
```

12 *Effects*: Equivalent to:

```
return apply([&](const auto&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, iters[n]...);
}, inner_.current_);
```

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> && three_way_comparable<inner-iterator<Const>>;
```

13 Let *op* be the operator.

14 *Effects*: Equivalent to: `return x.inner_ op y.inner_;`

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

15 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ + n);`

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

16 *Effects*: Equivalent to: `return iterator(*i.parent_, i.inner_ - n);`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<inner-iterator<Const>, inner-iterator<Const>>;
```

17 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.28.4 Class template adjacent_transform_view::*sentinel* [range.adjacent.transform.sentinel]

```
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
             regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
             can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
  template<bool Const>
  class adjacent_transform_view<V, F, N>::sentinel {
    inner-sentinel<Const> inner_;                                  // exposition only
    constexpr explicit sentinel(inner-sentinel<Const> inner);      // exposition only

  public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
      requires Const && convertible_to<inner-sentinel<false>, inner-sentinel<Const>>;

    template<bool OtherConst>
      requires sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
      requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
    friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
      operator-(const sentinel& x, const iterator<OtherConst>& y);
  };
}
```

```
constexpr explicit sentinel(inner-sentinel<Const> inner);
```

1 *Effects*: Initializes *inner_* with `inner`.

```
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<inner-sentinel<false>, inner-sentinel<Const>>;
```

2 *Effects*: Initializes *inner_* with `std::move(i.inner_)`.

```
template<bool OtherConst>
  requires sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

3 *Effects*: Equivalent to: `return x.inner_ == y.inner_;`

```
template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const sentinel& x, const iterator<OtherConst>& y);
```

4 *Effects*: Equivalent to: `return x.inner_ - y.inner_;`

25.7.29 Chunk view [range.chunk]

25.7.29.1 Overview [range.chunk.overview]

1 `chunk_view` takes a view and a number N and produces a range of views that are N-sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than N elements.

2 The name `views::chunk` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `N`, the expression `views::chunk(E, N)` is expression-equivalent to `chunk_view(E, N)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4, 5};

for (auto r : v | views::chunk(2)) {
  cout << '[';
  auto sep = "";
  for (auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "] ";
}
// The above prints [1, 2] [3, 4] [5]
```

— *end example*]

25.7.29.2 Class template `chunk_view` for input ranges [range.chunk.view.input]

```
namespace std::ranges {
  template<class I>
  constexpr I div-ceil(I num, I denom) {                    // exposition only
    I r = num / denom;
    if (num % denom)
      ++r;
    return r;
  }

  template<view V>
    requires input_range<V>
  class chunk_view : public view_interface<chunk_view<V>> {

```
friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

26 *Returns*: *div-ceil*`(x.end_ - x.current_, x.n_)`.

```
friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

27 *Effects*: Equivalent to: `return -(y - x);`

25.7.30 Slide view [range.slide]

25.7.30.1 Overview [range.slide.overview]

1 `slide_view` takes a view and a number N and produces a view whose M^{th} element is a view over the M^{th} through $(M + N - 1)^{\text{th}}$ elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name `views::slide` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `N`, the expression `views::slide(E, N)` is expression-equivalent to `slide_view(E, N)`.

[*Example 1*:

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::slide(2)) {
  cout << '[' << i[0] << ", " << i[1] << "] ";          // prints [1, 2] [2, 3] [3, 4]
}
```

— *end example*]

25.7.30.2 Class template `slide_view` [range.slide.view]

```
namespace std::ranges {
  template<class V>
  concept slide-caches-nothing = random_access_range<V> && sized_range<V>;       // exposition only

  template<class V>

  class slide_view : public view_interface<slide_view<V>> {
    V base_;                              // exposition only
    range_difference_t<V> n_;             // exposition only

    // 25.7.30.3, class template slide_view::iterator
    template<bool> class iterator;        // exposition only

    // 25.7.30.4, class slide_view::sentinel
    class sentinel;                       // exposition only
```

```
  public:
    constexpr explicit slide_view(V base, range_difference_t<V> n);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin()
      requires (!(simple-view<V> && slide-caches-nothing<const V>));
    constexpr auto begin() const requires slide-caches-nothing<const V>;

    constexpr auto end()
      requires (!(simple-view<V> && slide-caches-nothing<const V>));
    constexpr auto end() const requires slide-caches-nothing<const V>;

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };

  template<class R>
    slide_view(R&&, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}
```

```
constexpr explicit slide_view(V base, range_difference_t<V> n);
```

1 *Preconditions*: `n > 0` is `true`.

2 *Effects*: Initializes *base_* with `std::move(base)` and *n_* with `n`.

```
constexpr auto begin()
  requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

3 *Returns*:

(3.1) — If `V` models *slide-caches-first*,

```
iterator<false>(ranges::begin(base_),
                ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)
```

(3.2) — Otherwise, *iterator*`<false>(ranges::begin(`*base_*`), `*n_*`)`.

4 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `slide_view` for use on subsequent calls when `V` models *slide-caches-first*.

```
constexpr auto begin() const requires slide-caches-nothing<const V>;
```

5 *Returns*: *iterator*`<true>(ranges::begin(`*base_*`), `*n_*`)`.

```
constexpr auto end()
  requires (!(simple-view<V> && slide-caches-nothing<const V>));
```

6 *Returns*:

(6.1) — If `V` models *slide-caches-nothing*,

```
iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
```

(6.2) — Otherwise, if `V` models *slide-caches-last*,

```
iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
```

(6.3) — Otherwise, if `V` models `common_range`,

```
iterator<false>(ranges::end(base_), ranges::end(base_), n_)
```

(6.4) — Otherwise, *sentinel*`(ranges::end(`*base_*`))`.

7 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `slide_view` for use on subsequent calls when `V` models *slide-caches-last*.

```
constexpr auto end() const requires slide-caches-nothing<const V>;
```

8 *Returns*: `begin() + range_difference_t<const V>(size())`.

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

9 *Effects*: Equivalent to:

```
auto sz = ranges::distance(base_) - n_ + 1;
if (sz < 0) sz = 0;
return to-unsigned-like(sz);
```

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

10 *Effects*: Equivalent to:

```
auto sz = static_cast<range_difference_t<decltype((base_))>>(ranges::reserve_hint(base_)) -
                                                                    n_ + 1;
if (sz < 0) sz = 0;
return to-unsigned-like(sz);
```

25.7.30.3 Class template `slide_view::iterator` [range.slide.iterator]

```
namespace std::ranges {
  template<forward_range V>
    requires view<V>
  template<bool Const>
  class slide_view<V>::iterator {
    using Base = maybe-const<Const, V>;                  // exposition only
    iterator_t<Base> current_   = iterator_t<Base>();    // exposition only
    iterator_t<Base> last_ele_  = iterator_t<Base>();    // exposition only,
                                                         // present only if Base models slide-caches-first
    range_difference_t<Base> n_ = 0;                     // exposition only

    friend constexpr difference_type operator-(const iterator& x, const iterator& y)
      requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
  };
}
```

1 *iterator*`::iterator_concept` is defined as follows:

(1.1) — If *Base* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.2) — Otherwise, if *Base* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.3) — Otherwise, `iterator_concept` denotes `forward_iterator_tag`.

2 If the invocation of any non-const member function of *iterator* exits via an exception, the *iterator* acquires a singular value.

```
constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n)
  requires (!slide-caches-first<Base>);
```

3 *Effects*: Initializes *current_* with `current` and *n_* with `n`.

```
constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele,
                   range_difference_t<Base> n)
  requires slide-caches-first<Base>;
```

4 *Effects*: Initializes *current_* with `current`, *last_ele_* with `last_ele`, and *n_* with `n`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 *Effects*: Initializes *current_* with `std::move(i.`*current_*`)` and *n_* with `i.`*n_*.

[*Note 1*: *iterator*`<true>` can only be formed when *Base* models *slide-caches-nothing*, in which case *last_ele_* is not present. — *end note*]

```
constexpr auto operator*() const;
```

6 *Returns*: `views::counted(`*current_*`, `*n_*`)`.

```
constexpr iterator& operator++();
```

7 *Preconditions*: *current_* and *last_ele_* (if present) are incrementable.

8 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `ranges::next(i)`, where `i` is the value of that data member before the call.

9 *Returns*: `*this`.

```
constexpr iterator operator++(int);
```

10 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 *Preconditions*: *current_* and *last_ele_* (if present) are decrementable.

12 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `ranges::prev(i)`, where `i` is the value of that data member before the call.

13 *Returns*: `*this`.

```
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;
```

15 *Preconditions*: *current_* `+ x` and *last_ele_* `+ x` (if *last_ele_* is present) have well-defined behavior.

16 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `i + x`, where `i` is the value of that data member before the call.

17 *Returns*: `*this`.

```
constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;
```

18 *Preconditions*: *current_* `- x` and *last_ele_* `- x` (if *last_ele_* is present) have well-defined behavior.

19 *Postconditions*: *current_* and *last_ele_* (if present) are each equal to `i - x`, where `i` is the value of that data member before the call.

20 *Returns*: `*this`.

```
constexpr auto operator[](difference_type n) const
  requires random_access_range<Base>;
```

21 *Effects*: Equivalent to: `return views::counted(`*current_* `+ n, `*n_*`);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y);
```

22 *Returns*: If *last_ele_* is present, `x.`*last_ele_* `== y.`*last_ele_*; otherwise, `x.`*current_* `== y.`*current_*.

```
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

23 *Returns*: `x.`*current_* `< y.`*current_*.

```
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

24 *Effects*: Equivalent to: `return y < x;`

```
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

25 *Effects*: Equivalent to: `return !(y < x);`

```
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
```

26 *Effects*: Equivalent to: `return !(x < y);`

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> &&
           three_way_comparable<iterator_t<Base>>;
```

27 *Returns*: `x.current_ <=> y.current_`.

```
friend constexpr iterator operator+(const iterator& i, difference_type n)
  requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
  requires random_access_range<Base>;
```

28 *Effects*: Equivalent to:

```
auto r = i;
r += n;
return r;
```

```
friend constexpr iterator operator-(const iterator& i, difference_type n)
  requires random_access_range<Base>;
```

29 *Effects*: Equivalent to:

```
auto r = i;
r -= n;
return r;
```

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

30 *Returns*: If *last_ele_* is present, `x.last_ele_ - y.last_ele_`; otherwise, `x.current_ - y.current_`.

25.7.30.4 Class `slide_view::sentinel` [range.slide.sentinel]

```
namespace std::ranges {
  template<forward_range V>
    requires view<V>
  class slide_view<V>::sentinel {
    sentinel_t<V> end_ = sentinel_t<V>();              // exposition only
    constexpr explicit sentinel(sentinel_t<V> end);    // exposition only

  public:
    sentinel() = default;

    friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

    friend constexpr range_difference_t<V>
      operator-(const iterator<false>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

    friend constexpr range_difference_t<V>
      operator-(const sentinel& y, const iterator<false>& x)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
  };
}
```

1 [*Note 1*: *sentinel* is used only when *slide-caches-first*<V> is `true`. — *end note*]

```
constexpr explicit sentinel(sentinel_t<V> end);
```

2 *Effects*: Initializes *end_* with `end`.

```
friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);
```

3 *Returns*: `x.last_ele_ == y.end_`.

```
friend constexpr range_difference_t<V>
  operator-(const iterator<false>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

4 *Returns*: `x.last_ele_ - y.end_`.

```
friend constexpr range_difference_t<V>
  operator-(const sentinel& y, const iterator<false>& x)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

5 *Returns*: `y.end_ - x.last_ele_`.

25.7.31 Chunk by view [range.chunk.by]

25.7.31.1 Overview [range.chunk.by.overview]

1 `chunk_by_view` takes a view and a predicate, and splits the view into `subranges` between each pair of adjacent elements for which the predicate returns `false`.

2 The name `views::chunk_by` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `F`, the expression `views::chunk_by(E, F)` is expression-equivalent to `chunk_by_view(E, F)`.

[*Example 1*:

```
vector v = {1, 2, 2, 3, 0, 4, 5, 2};

for (auto r : v | views::chunk_by(ranges::less_equal{})) {
  cout << '[';
  auto sep = "";
  for (auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "] ";
}
// The above prints [1, 2, 2, 3] [0, 4, 5] [2]
```

— *end example*]

25.7.31.2 Class template `chunk_by_view` [range.chunk.by.view]

```
namespace std::ranges {
  template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
    V base_ = V();                                          // exposition only
    movable-box<Pred> pred_;                                // exposition only

    // 25.7.31.3, class chunk_by_view::iterator
    class iterator;                                         // exposition only

  public:
    chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr explicit chunk_by_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr iterator begin();
    constexpr auto end();

    constexpr iterator_t<V> find-next(iterator_t<V>);       // exposition only
    constexpr iterator_t<V> find-prev(iterator_t<V>)        // exposition only
      requires bidirectional_range<V>;
  };

  template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;
}
```

```
constexpr explicit chunk_by_view(V base, Pred pred);
```

1 *Effects*: Initializes `base_` with `std::move(base)` and `pred_` with `std::move(pred)`.

```
constexpr const Pred& pred() const;
```

2 *Effects*: Equivalent to: `return *pred_;`

```
constexpr iterator begin();
```

3 *Preconditions*: `pred_.has_value()` is `true`.

4 *Returns*: `iterator(*this, ranges::begin(base_), find-next(ranges::begin(base_)))`.

5 *Remarks*: In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `chunk_by_view` for use on subsequent calls.

```
constexpr auto end();
```

6 *Effects*: Equivalent to:

```
if constexpr (common_range<V>) {
  return iterator(*this, ranges::end(base_), ranges::end(base_));
} else {
  return default_sentinel;
}
```

```
constexpr iterator_t<V> find-next(iterator_t<V> current);
```

7 *Preconditions*: `pred_.has_value()` is `true`.

8 *Returns*:

```
ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
             1, ranges::end(base_))
```

```
constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;
```

9 *Preconditions*:

(9.1) — `current` is not equal to `ranges::begin(base_)`.

(9.2) — `pred_.has_value()` is `true`.

10 *Returns*: An iterator `i` in the range [`ranges::begin(base_)`, `current`) such that:

(10.1) — `ranges::adjacent_find(i, current, not_fn(ref(*pred_)))` is equal to `current`; and

(10.2) — if `i` is not equal to `ranges::begin(base_)`, then `bool(invoke(*pred_, *ranges::prev(i), *i))` is `false`.

25.7.31.3 Class `chunk_by_view::iterator` [range.chunk.by.iter]

```
namespace std::ranges {
  template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
  class chunk_by_view<V, Pred>::iterator {
    chunk_by_view* parent_ = nullptr;                                  // exposition only
    iterator_t<V> current_ = iterator_t<V>();                          // exposition only
    iterator_t<V> next_    = iterator_t<V>();                          // exposition only

    constexpr iterator(chunk_by_view& parent, iterator_t<V> current,   // exposition only
                       iterator_t<V> next);

  public:
    using value_type = subrange<iterator_t<V>>;
    using difference_type  = range_difference_t<V>;
    using iterator_category = input_iterator_tag;
    using iterator_concept = see below;

    iterator() = default;

    constexpr value_type operator*() const;
    constexpr iterator& operator++();
    constexpr iterator operator++(int);
```

```
    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr bool operator==(const iterator& x, default_sentinel_t);
  };
}
```

1 *iterator*`::iterator_concept` is defined as follows:

(1.1) — If `V` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.2) — Otherwise, `iterator_concept` denotes `forward_iterator_tag`.

`constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);`

2 *Effects*: Initializes *`parent_`* with `addressof(parent)`, *`current_`* with `current`, and *`next_`* with `next`.

`constexpr value_type operator*() const;`

3 *Preconditions*: *`current_`* is not equal to *`next_`*.

4 *Returns*: `subrange(`*`current_`*`, `*`next_`*`)`.

`constexpr iterator& operator++();`

5 *Preconditions*: *`current_`* is not equal to *`next_`*.

6 *Effects*: Equivalent to:

```
current_ = next_;
next_ = parent_->find-next(current_);
return *this;
```

`constexpr iterator operator++(int);`

7 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

`constexpr iterator& operator--() requires bidirectional_range<V>;`

8 *Effects*: Equivalent to:

```
next_ = current_;
current_ = parent_->find-prev(next_);
return *this;
```

`constexpr iterator operator--(int) requires bidirectional_range<V>;`

9 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

`friend constexpr bool operator==(const iterator& x, const iterator& y);`

10 *Returns*: `x.`*`current_`* `== y.`*`current_`*.

`friend constexpr bool operator==(const iterator& x, default_sentinel_t);`

11 *Returns*: `x.`*`current_`* `== x.`*`next_`*.

25.7.32 Stride view [range.stride]

25.7.32.1 Overview [range.stride.overview]

1 `stride_view` presents a view of an underlying sequence, advancing over n elements at a time, as opposed to the usual single-step succession.

2 The name `views::stride` denotes a range adaptor object (25.7.2). Given subexpressions `E` and `N`, the expression `views::stride(E, N)` is expression-equivalent to `stride_view(E, N)`.

[3] [*Example 1*:

```
auto input = views::iota(0, 12) | views::stride(3);
ranges::copy(input, ostream_iterator<int>(cout, " "));                  // prints 0 3 6 9
ranges::copy(input | views::reverse, ostream_iterator<int>(cout, " ")); // prints 9 6 3 0
```

— *end example*]

25.7.32.2 Class template `stride_view` [range.stride.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class stride_view : public view_interface<stride_view<V>> {
    V base_;                                        // exposition only
    range_difference_t<V> stride_;                  // exposition only
    // 25.7.32.3, class template stride_view::iterator
    template<bool> class iterator;                  // exposition only
  public:
    constexpr explicit stride_view(V base, range_difference_t<V> stride);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr range_difference_t<V> stride() const noexcept;

    constexpr auto begin() requires (!simple-view<V>) {
      return iterator<false>(this, ranges::begin(base_));
    }

    constexpr auto begin() const requires range<const V> {
      return iterator<true>(this, ranges::begin(base_));
    }

```

1 *iterator*`::iterator_concept` is defined as follows:

(1.1) — If *`Base`* models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.

(1.2) — Otherwise, if *`Base`* models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.

(1.3) — Otherwise, if *`Base`* models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

(1.4) — Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member *typedef-name* `iterator_category` is declared if and only if *`Base`* models `forward_range`. In that case, *`iterator`*`::iterator_category` is defined as follows:

(2.1) — Let `C` denote the type `iterator_traits<iterator_t<`*`Base`*`>>::iterator_category`.

(2.2) — If `C` models `derived_from<random_access_iterator_tag>`, then `iterator_category` denotes `random_access_iterator_tag`.

(2.3) — Otherwise, `iterator_category` denotes `C`.

```
constexpr iterator(Parent* parent, iterator_t<Base> current,
                   range_difference_t<Base> missing = 0);
```

3 *Effects*: Initializes *current_* with `std::move(current)`, *end_* with `ranges::end(parent->base_)`, *stride_* with `parent->stride_`, and *missing_* with `missing`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>
                 && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
```

4 *Effects*: Initializes *current_* with `std::move(i.current_)`, *end_* with `std::move(i.end_)`, *stride_* with `i.stride_`, and *missing_* with `i.missing_`.

```
constexpr iterator_t<Base> base() &&;
```

5 *Returns*: `std::move(current_)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

6 *Returns*: *current_*.

```
constexpr iterator& operator++();
```

7 *Preconditions*: *current_* `!=` *end_* is `true`.

8 *Effects*: Equivalent to:

```
missing_ = ranges::advance(current_, stride_, end_);

  requires indirectly_swappable<iterator_t<Base>>;
```

29 *Effects*: Equivalent to: `ranges::iter_swap(x.current_, y.current_);`

25.7.33 Cartesian product view [range.cartesian]

25.7.33.1 Overview [range.cartesian.overview]

1 `cartesian_product_view` takes any non-zero number of ranges n and produces a view of tuples calculated by the n-ary cartesian product of the provided ranges.

2 The name `views::cartesian_product` denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions `Es`, the expression `views::cartesian_product(Es...)` is expression-equivalent to

(2.1) — `views::single(tuple())` if `Es` is an empty pack,

(2.2) — otherwise, `cartesian_product_view<views::all_t<decltype((Es))>...>(Es...)`.

3 [*Example 1*:

```
vector<int> v { 0, 1, 2 };
for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
  cout << a << ' ' << b << ' ' << c << '\n';
}
// The above prints
// 0 0 0
// 0 0 1
// 0 0 2
// 0 1 0
// 0 1 1
// ...
```

— *end example*]

25.7.33.2 Class template `cartesian_product_view` [range.cartesian.view]

```
namespace std::ranges {
  template<bool Const, class First, class... Vs>
  concept cartesian-product-is-random-access =          // exposition only
    (random_access_range<maybe-const<Const, First>> && ... &&
      (random_access_range<maybe-const<Const, Vs>>
        && sized_range<maybe-const<Const, Vs>>));

  template<class R>
  concept cartesian-product-common-arg =                // exposition only
    common_range<R> || (sized_range<R> && random_access_range<R>);

  template<bool Const, class First, class... Vs>
  concept cartesian-product-is-bidirectional =          // exposition only
    (bidirectional_range<maybe-const<Const, First>> && ... &&
      (bidirectional_range<maybe-const<Const, Vs>>
        && cartesian-product-common-arg<maybe-const<Const, Vs>>));

  template<class First, class...>
  concept cartesian-product-is-common =                 // exposition only
    cartesian-product-common-arg<First>;
```

```
  template<class... Vs>
  concept cartesian-product-is-sized =                    // exposition only
    (sized_range<Vs> && ...);

  template<bool Const, template<class> class FirstSent, class First, class... Vs>
    concept cartesian-is-sized-sentinel =                 // exposition only
      (sized_sentinel_for<FirstSent<maybe-const<Const, First>>,
          iterator_t<maybe-const<Const, First>>> && ...
        && (sized_range<maybe-const<Const, Vs>>
          && sized_sentinel_for<iterator_t<maybe-const<Const, Vs>>,
              iterator_t<maybe-const<Const, Vs>>>));

  template<cartesian-product-common-arg R>
  constexpr auto cartesian-common-arg-end(R& r) {         // exposition only
    if constexpr (common_range<R>) {
      return ranges::end(r);
    } else {
      return ranges::begin(r) + ranges::distance(r);
    }
  }

  template<input_range First, forward_range... Vs>
    requires (view<First> && ... && view<Vs>)
  class cartesian_product_view : public view_interface<cartesian_product_view<First, Vs...>> {
  private:
    tuple<First, Vs...> bases_;                           // exposition only
    // 25.7.33.3, class template cartesian_product_view::iterator
    template<bool Const> class iterator;                  // exposition only

  public:
    constexpr cartesian_product_view() = default;
    constexpr explicit cartesian_product_view(First first_base, Vs... bases);

    constexpr iterator<false> begin()
      requires (!simple-view<First> || ... || !simple-view<Vs>);
    constexpr iterator<true> begin() const
      requires (range<const First> && ... && range<const Vs>);

    constexpr iterator<false> end()
      requires ((!simple-view<First> || ... || !simple-view<Vs>) &&
        cartesian-product-is-common<First, Vs...>);
    constexpr iterator<true> end() const
      requires cartesian-product-is-common<const First, const Vs...>;
    constexpr default_sentinel_t end() const noexcept;

    constexpr see below size()
      requires cartesian-product-is-sized<First, Vs...>;
    constexpr see below size() const
      requires cartesian-product-is-sized<const First, const Vs...>;
  };

  template<class... Vs>
    cartesian_product_view(Vs&&...) -> cartesian_product_view<views::all_t<Vs>...>;
}
```

```
constexpr explicit cartesian_product_view(First first_base, Vs... bases);
```

1 *Effects*: Initializes *bases_* with `std::move(first_base)`, `std::move(bases)`....

```
constexpr iterator<false> begin()
  requires (!simple-view<First> || ... || !simple-view<Vs>);
```

2 *Effects*: Equivalent to:

```
return iterator<false>(*this, tuple-transform(ranges::begin, bases_));
```

```
constexpr iterator<true> begin() const
  requires (range<const First> && ... && range<const Vs>);
```

3 *Effects*: Equivalent to:

```
return iterator<true>(*this, tuple-transform(ranges::begin, bases_));
```

```
constexpr iterator<false> end()
  requires ((!simple-view<First> || ... || !simple-view<Vs>)
    && cartesian-product-is-common<First, Vs...>);
constexpr iterator<true> end() const
  requires cartesian-product-is-common<const First, const Vs...>;
```

4 Let:

(4.1) — *is-const* be `true` for the const-qualified overload, and `false` otherwise;

(4.2) — *is-empty* be `true` if the expression `ranges::empty(rng)` is `true` for any `rng` among the underlying ranges except the first one and `false` otherwise; and

(4.3) — *begin-or-first-end*`(rng)` be expression-equivalent to *is-empty* `? ranges::begin(rng) :` *cartesian-common-arg-end*`(rng)` if `rng` is the first underlying range and `ranges::begin(rng)` otherwise.

5 *Effects*: Equivalent to:

```
iterator<is-const> it(*this, tuple-transform(
  [](auto& rng){ return begin-or-first-end(rng); }, bases_));
return it;
```

```
constexpr default_sentinel_t end() const noexcept;
```

6 *Returns*: `default_sentinel`.

```
constexpr see below size()
  requires cartesian-product-is-sized<First, Vs...>;
constexpr see below size() const
  requires cartesian-product-is-sized<const First, const Vs...>;
```

7 The return type is an implementation-defined unsigned-integer-like type.

8 *Recommended practice*: The return type should be the smallest unsigned-integer-like type that is sufficiently wide to store the product of the maximum sizes of all the underlying ranges, if such a type exists.

9 Let p be the product of the sizes of all the ranges in *bases_*.

10 *Preconditions*: p can be represented by the return type.

11 *Returns*: p.

25.7.33.3 Class template `cartesian_product_view::`*iterator* [range.cartesian.iterator]

```

```

1 *iterator*::iterator_concept is defined as follows:

(1.1) — If *cartesian-product-is-random-access*<Const, First, Vs...> is modeled, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if *cartesian-product-is-bidirectional*<Const, First, Vs...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if *maybe-const*<Const, First> models forward_range, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 *iterator*::difference_type is an implementation-defined signed-integer-like type.

3 *Recommended practice*: *iterator*::difference_type should be the smallest signed-integer-like type that is sufficiently wide to store the product of the maximum sizes of all underlying ranges if such a type exists.

```
template<size_t N = sizeof...(Vs)>
  constexpr void next();
```

4 *Effects*: Equivalent to:

```
auto& it = std::get<N>(current_);
++it;
if constexpr (N > 0) {
  if (it == ranges::end(std::get<N>(parent_->bases_))) {
    it = ranges::begin(std::get<N>(parent_->bases_));
    next<N - 1>();
  }
}
```

```
template<size_t N = sizeof...(Vs)>
  constexpr void prev();
```

5 *Effects*: Equivalent to:

```
auto& it = std::get<N>(current_);
if constexpr (N > 0) {
  if (it == ranges::begin(std::get<N>(parent_->bases_))) {
    it = cartesian-common-arg-end(std::get<N>(parent_->bases_));
    prev<N - 1>();
  }
}
--it;
```

```
template<class Tuple>
  constexpr difference_type distance-from(const Tuple& t) const;
```

6 Let:

(6.1) — *scaled-size*(N) be the product of static_cast<difference_type>(ranges::size(std::get<N>(*parent_->bases_*))) and *scaled-size*($N+1$) if $N \leq$ sizeof...(Vs), otherwise static_cast<difference_type>(1);

(6.2) — *scaled-distance*(N) be the product of static_cast<difference_type>(std::get<N>(*current_*) - std::get<N>(t)) and *scaled-size*($N+1$); and

(6.3) — *scaled-sum* be the sum of *scaled-distance*(N) for every integer $0 \leq N \leq$ sizeof...(Vs).

7 *Preconditions*: *scaled-sum* can be represented by difference_type.

8 *Returns*: *scaled-sum*.

```
constexpr iterator(Parent& parent, tuple<iterator_t<maybe-const<Const, First>>,
  iterator_t<maybe-const<Const, Vs>>...> current);
```

9 *Effects*: Initializes *parent_* with addressof(parent) and *current_* with std::move(current).

```
constexpr iterator(iterator<!Const> i) requires Const &&
  (convertible_to<iterator_t<First>, iterator_t<const First>> &&
    ... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);
```

10 *Effects*: Initializes *parent_* with `i.`*parent_* and *current_* with `std::move(i.`*current_*`)`.

```
constexpr auto operator*() const;
```

11 *Effects*: Equivalent to:

```
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```
constexpr iterator& operator++();
```

12 *Effects*: Equivalent to:

```
next();
return *this;
```

```
constexpr void operator++(int);
```

13 *Effects*: Equivalent to `++*this`.

```
constexpr iterator operator++(int) requires forward_range<maybe-const<Const, First>>;
```

14 *Effects*: Equivalent to:

```
auto tmp = *this;
++*this;
return tmp;
```

```
constexpr iterator& operator--()
  requires cartesian-product-is-bidirectional<Const, First, Vs...>;
```

15 *Effects*: Equivalent to:

```
prev();
return *this;
```

```
constexpr iterator operator--(int)
  requires cartesian-product-is-bidirectional<Const, First, Vs...>;
```

16 *Effects*: Equivalent to:

```
auto tmp = *this;
--*this;
return tmp;
```

```
constexpr iterator& operator+=(difference_type x)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

17 Let `orig` be the value of `*this` before the call.

Let `ret` be:

(17.1) — If `x > 0`, the value of `*this` had *next* been called `x` times.

(17.2) — Otherwise, if `x < 0`, the value of `*this` had *prev* been called `-x` times.

(17.3) — Otherwise, `orig`.

18 *Preconditions*: `x` is in the range [`ranges::distance(*this, ranges::begin(*`*parent_*`))`, `ranges::distance(*this, ranges::end(*`*parent_*`))`].

19 *Effects*: Sets the value of `*this` to `ret`.

20 *Returns*: `*this`.

21 *Complexity*: Constant.

```
constexpr iterator& operator-=(difference_type x)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

22 *Effects*: Equivalent to:

```
*this += -x;
return *this;
```

©ISO/IEC

```
constexpr reference operator[](difference_type n) const
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

23 *Effects*: Equivalent to: `return *((*this) + n);`

```
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<maybe-const<Const, First>>>;
```

24 *Effects*: Equivalent to: `return x.current_ == y.current_;`

```
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
```

25 *Returns*: `true` if `std::get<`*i*`>(x.current_) == ranges::end(std::get<`*i*`>(x.parent_->bases_))` is `true` for any integer $0 \leq i \leq$ `sizeof...(Vs)`; otherwise, `false`.

```
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires all-random-access<Const, First, Vs...>;
```

26 *Effects*: Equivalent to: `return x.current_ <=> y.current_;`

```
friend constexpr iterator operator+(const iterator& x, difference_type y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

27 *Effects*: Equivalent to: `return iterator(x) += y;`

```
friend constexpr iterator operator+(difference_type x, const iterator& y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

28 *Effects*: Equivalent to: `return y + x;`

```
friend constexpr iterator operator-(const iterator& x, difference_type y)
  requires cartesian-product-is-random-access<Const, First, Vs...>;
```

29 *Effects*: Equivalent to: `return iterator(x) -= y;`

```
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;
```

30 *Effects*: Equivalent to: `return x.distance-from(y.current_);`

```
friend constexpr difference_type operator-(const iterator& i, default_sentinel_t)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;
```

31 Let *end-tuple* be an object of a type that is a specialization of `tuple`, such that:

(31.1) — `std::get<0>(`*end-tuple*`)` has the same value as `ranges::end(std::get<0>(i.parent_->bases_))`;

(31.2) — `std::get<`*N*`>(`*end-tuple*`)` has the same value as `ranges::begin(std::get<`*N*`>(i.parent_->bases_))` for every integer $1 \leq N \leq$ `sizeof...(Vs)`.

32 *Effects*: Equivalent to: `return i.distance-from(`*end-tuple*`);`

```
friend constexpr difference_type operator-(default_sentinel_t s, const iterator& i)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;
```

33 *Effects*: Equivalent to: `return -(i - s);`

```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);
```

34 *Effects*: Equivalent to: `return tuple-transform(ranges::iter_move, i.current_);`

35 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

(35.1) — `noexcept(ranges::iter_move(std::get<`*N*`>(i.current_)))` for every integer $0 \leq N \leq$ `sizeof...(Vs)`,

(35.2) — `is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const, T>>>` for every type `T` in `First, Vs...`.

```
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires (indirectly_swappable<iterator_t<maybe-const<Const, First>>> && ... &&
        indirectly_swappable<iterator_t<maybe-const<Const, Vs>>>);
```

36 *Effects*: For every integer $0 \leq i \leq$ `sizeof...(Vs)`, performs:

`ranges::iter_swap(std::get<`*i*`>(l.`*current_*`), std::get<`*i*`>(r.`*current_*`))`

37 *Remarks*: The exception specification is equivalent to the logical AND of the following expressions:

(37.1) — `noexcept(ranges::iter_swap(std::get<`*i*`>(l.`*current_*`), std::get<`*i*`>(r.`*current_*`)))` for every integer $0 \leq i \leq$ `sizeof...(Vs)`.

25.7.34 Cache latest view [range.cache.latest]

25.7.34.1 Overview [range.cache.latest.overview]

1 `cache_latest_view` caches the last-accessed element of its underlying sequence so that the element does not have to be recomputed on repeated access.

[*Note 1*: This is useful if computation of the element to produce is expensive. — *end note*]

2 The name `views::cache_latest` denotes a range adaptor object (25.7.2). Let `E` be an expression. The expression `views::cache_latest(E)` is expression-equivalent to `cache_latest_view(E)`.

25.7.34.2 Class template `cache_latest_view` [range.cache.latest.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class cache_latest_view : public view_interface<cache_latest_view<V>> {
    V base_ = V();                                                          // exposition only
    using cache-t = conditional_t<is_reference_v<range_reference_t<V>>,     // exposition only
                                  add_pointer_t<range_reference_t<V>>,
                                  range_reference_t<V>>;

    non-propagating-cache<cache-t> cache_;                                  // exposition only

    // 25.7.34.3, class cache_latest_view::iterator
    class iterator;                                                         // exposition only
    // 25.7.34.4, class cache_latest_view::sentinel
    class sentinel;                                                         // exposition only

  public:
    cache_latest_view() requires default_initializable<V> = default;
    constexpr explicit cache_latest_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin();
    constexpr auto end();

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };

  template<class R>
    cache_latest_view(R&&) -> cache_latest_view<views::all_t<R>>;
}
```

`constexpr explicit cache_latest_view(V base);`

1 *Effects*: Initializes *base_* with `std::move(base)`.

`constexpr auto begin();`

2 *Effects*: Equivalent to: `return` *iterator*`(*this);`

`constexpr auto end();`

3 *Effects*: Equivalent to: `return` *sentinel*`(*this);`

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

4 *Effects*: Equivalent to: `return ranges::size(base_);`

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

5 *Effects*: Equivalent to: `return ranges::reserve_hint(base_);`

25.7.34.3 Class `cache_latest_view::iterator` [range.cache.latest.iterator]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class cache_latest_view<V>::iterator {
    cache_latest_view* parent_;                                  // exposition only
    iterator_t<V> current_;                                      // exposition only

    constexpr explicit iterator(cache_latest_view& parent);      // exposition only

  public:
    using difference_type = range_difference_t<V>;
    using value_type = range_value_t<V>;
    using iterator_concept = input_iterator_tag;

    iterator(iterator&&) = default;
    iterator& operator=(iterator&&) = default;

    constexpr iterator_t<V> base() &&;
    constexpr const iterator_t<V>& base() const & noexcept;

    constexpr range_reference_t<V>& operator*() const;

    constexpr iterator& operator++();
    constexpr void operator++(int);

    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current_)));

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<V>>;
  };
}
```

```
constexpr explicit iterator(cache_latest_view& parent);
```

1 *Effects*: Initializes *current_* with `ranges::begin(parent.base_)` and *parent_* with `addressof(parent)`.

```
constexpr iterator_t<V> base() &&;
```

2 *Returns*: `std::move(current_)`.

```
constexpr const iterator_t<V>& base() const & noexcept;
```

3 *Returns*: *current_*.

```
constexpr iterator& operator++();
```

4 *Effects*: Equivalent to:

```
parent_->cache_.reset();
++current_;
return *this;
```

```
constexpr void operator++(int);
```

5 *Effects*: Equivalent to: `++*this`.

```
constexpr range_reference_t<V>& operator*() const;
```

6 *Effects*: Equivalent to:

```
if constexpr (is_reference_v<range_reference_t<V>>) {
  if (!parent_->cache_) {
    parent_->cache_ = addressof(as-lvalue(*current_));
  }
  return **parent_->cache_;
} else {
  if (!parent_->cache_) {
    parent_->cache_.emplace-deref(current_);
  }
  return *parent_->cache_;
}
```

[*Note 1*: Evaluations of `operator*` on the same iterator object can conflict (6.10.2.2). — *end note*]

```
friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

7 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<V>>;
```

8 *Effects*: Equivalent to `ranges::iter_swap(x.current_, y.current_)`.

25.7.34.4 Class `cache_latest_view::sentinel` [range.cache.latest.sentinel]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class cache_latest_view<V>::sentinel {
    sentinel_t<V> end_ = sentinel_t<V>();                    // exposition only

    constexpr explicit sentinel(cache_latest_view& parent);  // exposition only

  public:
    sentinel() = default;

    constexpr sentinel_t<V> base() const;

    friend constexpr bool operator==(const iterator& x, const sentinel& y);

    friend constexpr range_difference_t<V> operator-(const iterator& x, const sentinel& y)
      requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
    friend constexpr range_difference_t<V> operator-(const sentinel& x, const iterator& y)
      requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
  };
}
```

```
constexpr explicit sentinel(cache_latest_view& parent);
```

1 *Effects*: Initializes *end_* with `ranges::end(parent.base_)`.

```
constexpr sentinel_t<V> base() const;
```

2 *Returns*: *end_*.

```
friend constexpr bool operator==(const iterator& x, const sentinel& y);
```

3 *Returns*: `x.current_ == y.end_`.

```
friend constexpr range_difference_t<V> operator-(const iterator& x, const sentinel& y)
  requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

4 *Returns*: `x.current_ - y.end_`.

```
friend constexpr range_difference_t<V> operator-(const sentinel& x, const iterator& y)
  requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
```

5 *Returns*: `x.end_ - y.current_`.

25.7.35 As input view [range.as.input]

25.7.35.1 Overview [range.as.input.overview]

1 `as_input_view` presents a view of an underlying sequence as an input-only non-common range.

[*Note 1*: This is useful to avoid overhead that can be necessary to provide support for the operations needed for greater iterator strength. — *end note*]

2 The name `views::as_input` denotes a range adaptor object (25.7.2). Let `E` be an expression and let `T` be `decltype((E))`. The expression `views::as_input(E)` is expression-equivalent to:

(2.1) — `views::all(E)` if `T` models `input_range`, does not satisfy `common_range`, and does not satisfy `forward_range`.

(2.2) — Otherwise, `as_input_view(E)`.

25.7.35.2 Class template `as_input_view` [range.as.input.view]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  class as_input_view : public view_interface<as_input_view<V>> {
    V base_ = V();                          // exposition only

    // 25.7.35.3, class template as_input_view::iterator
    template<bool Const> class iterator;  // exposition only

  public:
    as_input_view() requires default_initializable<V> = default;
    constexpr explicit as_input_view(V base);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple-view<V>);
    constexpr auto begin() const requires range<const V>;

    constexpr auto end() requires (!simple-view<V>);
    constexpr auto end() const requires range<const V>;

    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;

    constexpr auto reserve_hint() requires approximately_sized_range<V>;
    constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
  };

  template<class R>
    as_input_view(R&&) -> as_input_view<views::all_t<R>>;
}
```

```
constexpr explicit as_input_view(V base);
```

1 *Effects*: Initializes `base_` with `std::move(base)`.

```
constexpr auto begin() requires (!simple-view<V>);
```

2 *Effects*: Equivalent to: `return iterator<false>(ranges::begin(base_));`

```
constexpr auto begin() const requires range<const V>;
```

3 *Effects*: Equivalent to: `return iterator<true>(ranges::begin(base_));`

```
constexpr auto end() requires (!simple-view<V>);
constexpr auto end() const requires range<const V>;
```

4 *Effects*: Equivalent to: `return ranges::end(base_);`

```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
```

5 *Effects*: Equivalent to: `return ranges::size(base_);`

```
constexpr auto reserve_hint() requires approximately_sized_range<V>;
constexpr auto reserve_hint() const requires approximately_sized_range<const V>;
```

6 *Effects*: Equivalent to: `return ranges::reserve_hint(base_);`

25.7.35.3 Class template as_input_view::*iterator* [range.as.input.iterator]

```
namespace std::ranges {
  template<input_range V>
    requires view<V>
  template<bool Const>
  class as_input_view<V>::iterator {
    using Base = maybe-const<Const, V>;                          // exposition only

    iterator_t<Base> current_ = iterator_t<Base>();              // exposition only

    constexpr explicit iterator(iterator_t<Base> current);       // exposition only

  public:
    using difference_type = range_difference_t<Base>;
    using value_type = range_value_t<Base>;
    using iterator_concept = input_iterator_tag;

    iterator() requires default_initializable<iterator_t<Base>> = default;

    iterator(iterator&&) = default;
    iterator& operator=(iterator&&) = default;

    constexpr iterator(iterator<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

    constexpr iterator_t<Base> base() &&;
    constexpr const iterator_t<Base>& base() const & noexcept;

    constexpr decltype(auto) operator*() const { return *current_; }

    constexpr iterator& operator++();
    constexpr void operator++(int);

    friend constexpr bool operator==(const iterator& x, const sentinel_t<Base>& y);

    friend constexpr difference_type operator-(const sentinel_t<Base>& y, const iterator& x)
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
    friend constexpr difference_type operator-(const iterator& x, const sentinel_t<Base>& y)
      requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

    friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
      noexcept(noexcept(ranges::iter_move(i.current_)));

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
      noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
      requires indirectly_swappable<iterator_t<Base>>;
  };
}
```

```
constexpr explicit iterator(iterator_t<Base> current);
```

1 *Effects*: Initializes *current_* with `std::move(current)`.

```
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

2 *Effects*: Initializes *current_* with `std::move(i.current_)`.

```
constexpr iterator_t<Base> base() &&;
```

3 *Returns*: `std::move(current_)`.

```
constexpr const iterator_t<Base>& base() const & noexcept;
```

4 *Returns*: *current_*.

```
constexpr iterator& operator++();
```

5 *Effects*: Equivalent to:

```
++current_;
return *this;
```

```
constexpr void operator++(int);
```

6 *Effects*: Equivalent to: `++*this;`

```
friend constexpr bool operator==(const iterator& x, const sentinel_t<Base>& y);
```

7 *Returns*: `x.current_ == y`.

```
friend constexpr difference_type operator-(const sentinel_t<Base>& y, const iterator& x)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

8 *Returns*: `y - x.current_`.

```
friend constexpr difference_type operator-(const iterator& x, const sentinel_t<Base>& y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
```

9 *Returns*: `x.current_ - y`.

```
friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current_)));
```

10 *Effects*: Equivalent to: `return ranges::iter_move(i.current_);`

```
friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
  requires indirectly_swappable<iterator_t<Base>>;
```

11 *Effects*: Equivalent to: `ranges::iter_swap(x.current_, y.current_);`

25.8 Range generators [coro.generator]

25.8.1 Overview [coroutine.generator.overview]

1 Class template `generator` presents a view of the elements yielded by the evaluation of a coroutine.

2 A `generator` generates a sequence of elements by repeatedly resuming the coroutine from which it was returned. Elements of the sequence are produced by the coroutine each time a `co_yield` statement is evaluated. When the `co_yield` statement is of the form `co_yield elements_of(r)`, each element of the range `r` is successively produced as an element of the sequence.

[*Example 1*:

```
generator<int> ints(int start = 0) {
  while (true)
    co_yield start++;
}

void f() {
  for (auto i : ints() | views::take(3))
    cout << i << ' ';       // prints 0 1 2
}
```

— *end example*]

25.8.2 Header <generator> synopsis [generator.syn]

```
namespace std {
  // 25.8.3, class template generator
  template<class Ref, class Val = void, class Allocator = void>
    class generator;

  namespace pmr {
    template<class Ref, class Val = void>
      using generator = std::generator<Ref, Val, polymorphic_allocator<>>;
  }
}
```

25.8.3 Class template generator [coro.generator.class]

```
namespace std {
  template<class Ref, class Val = void, class Allocator = void>
  class generator : public ranges::view_interface<generator<Ref, Val, Allocator>> {
  private:
    using value = conditional_t<is_void_v<Val>, remove_cvref_t<Ref>, Val>;  // exposition only
    using reference = conditional_t<is_void_v<Val>, Ref&&, Ref>;           // exposition only

    // 25.8.6, class generator::iterator
    class iterator;                                                        // exposition only

  public:
    using yielded =
      conditional_t<is_reference_v<reference>, reference, const reference&>;

    // 25.8.5, class generator::promise_type
    class promise_type;

    generator(const generator&) = delete;
    generator(generator&& other) noexcept;

    ~generator();

    generator& operator=(generator other) noexcept;

    iterator begin();
    default_sentinel_t end() const noexcept;

  private:
    coroutine_handle<promise_type> coroutine_ = nullptr;  // exposition only
    unique_ptr<stack<coroutine_handle<>>> active_;        // exposition only
  };
}
```

1 *Mandates*:

(1.1) — If `Allocator` is not `void`, `allocator_traits<Allocator>::pointer` is a pointer type.

(1.2) — *`value`* is a cv-unqualified object type.

(1.3) — *`reference`* is either a reference type, or a cv-unqualified object type that models `copy_constructible`.

(1.4) — Let `RRef` denote `remove_reference_t<`*`reference`*`>&&` if *`reference`* is a reference type, and *`reference`* otherwise. Each of:

(1.4.1) — `common_reference_with<`*`reference`*`&&, `*`value`*`&>`,

(1.4.2) — `common_reference_with<`*`reference`*`&&, RRef&&>`, and

(1.4.3) — `common_reference_with<RRef&&, const `*`value`*`&>`

is modeled.

[*Note 1*: These requirements ensure the exposition-only *iterator* type can model `indirectly_readable` and thus `input_iterator`. — *end note*]

2 If `Allocator` is not `void`, it shall meet the *Cpp17Allocator* requirements.

3 Specializations of `generator` model `view` and `input_range`.

4 The behavior of a program that adds a specialization for `generator` is undefined.

25.8.4 Members [coro.generator.members]

```
generator(generator&& other) noexcept;
```

1 *Effects*: Initializes *coroutine_* with `exchange(other.`*coroutine_*`, {})` and *active_* with `exchange(other.`*active_*`, nullptr)`.

2 [*Note 1*: Iterators previously obtained from `other` are not invalidated; they become iterators into `*this`. — *end note*]

```
~generator();
```

3 *Effects*: Equivalent to:

```
if (coroutine_) {
  coroutine_.destroy();
}
```

4 [*Note 2*: Ownership of recursively yielded generators is held in awaitable objects in the coroutine frame of the yielding generator, so destroying the root generator effectively destroys the entire stack of yielded generators. — *end note*]

```
generator& operator=(generator other) noexcept;
```

5 *Effects*: Equivalent to:

```
swap(coroutine_, other.coroutine_);
swap(active_, other.active_);
```

6 *Returns*: `*this`.

7 [*Note 3*: Iterators previously obtained from `other` are not invalidated; they become iterators into `*this`. — *end note*]

```
iterator begin();
```

8 *Preconditions*: *coroutine_* refers to a coroutine suspended at its initial suspend point (9.6.4).

9 *Effects*: Pushes *coroutine_* into `*`*active_*, then evaluates *coroutine_*`.resume()`.

10 *Returns*: An *iterator* object whose member *coroutine_* refers to the same coroutine as does *coroutine_*.

11 [*Note 4*: A program that calls `begin` more than once on the same generator has undefined behavior. — *end note*]

```
default_sentinel_t end() const noexcept;
```

12 *Returns*: `default_sentinel`.

25.8.5 Class `generator::promise_type` [coro.generator.promise]

```
namespace std {
  template<class Ref, class Val, class Allocator>
  class generator<Ref, Val, Allocator>::promise_type {
  public:
    generator get_return_object() noexcept;

    suspend_always initial_suspend() const noexcept { return {}; }
    auto final_suspend() noexcept;

    suspend_always yield_value(yielded val) noexcept;

    auto yield_value(const remove_reference_t<yielded>& lval)
      requires is_rvalue_reference_v<yielded> &&
        constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;
```

```
      template<class R2, class V2, class Alloc2, class Unused>
        requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
          auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
      template<class R2, class V2, class Alloc2, class Unused>
        requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
          auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&, Unused> g) noexcept;

      template<ranges::input_range R, class Alloc>
        requires convertible_to<ranges::range_reference_t<R>, yielded>
          auto yield_value(ranges::elements_of<R, Alloc> r);

      void await_transform() = delete;

      void return_void() const noexcept {}
      void unhandled_exception();

      void* operator new(size_t size)
        requires same_as<Allocator, void> || default_initializable<Allocator>;

      template<class Alloc, class... Args>
        void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);

      template<class This, class Alloc, class... Args>
        void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                           const Args&...);

      void operator delete(void* pointer, size_t size) noexcept;

    private:
      add_pointer_t<yielded> value_ = nullptr;     // exposition only
      exception_ptr except_;                       // exposition only
    };
  }
```

`generator get_return_object() noexcept;`

1 *Returns*: A `generator` object whose member *`coroutine_`* is `coroutine_handle<promise_type>::from_promise(*this)`, and whose member *`active_`* points to an empty stack.

`auto final_suspend() noexcept;`

2 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*`*`active_`* of some `generator` object `x`. This function is called by that coroutine upon reaching its final suspend point (9.6.4).

3 *Returns*: An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the calling coroutine to be suspended, pop the coroutine handle from the top of `*x.`*`active_`*, and resume execution of the coroutine referred to by `x.`*`active_`*`->top()` if `*x.`*`active_`* is not empty. If it is empty, control flow returns to the current coroutine caller or resumer (9.6.4).

`suspend_always yield_value(yielded val) noexcept;`

4 *Effects*: Equivalent to *`value_`* `= addressof(val)`.

5 *Returns*: `{}`.

```
auto yield_value(const remove_reference_t<yielded>& lval)
  requires is_rvalue_reference_v<yielded> &&
    constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;
```

6 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*`*`active_`* of some `generator` object.

7 *Returns*: An awaitable object of an unspecified type (7.6.2.4) that stores an object of type `remove_cvref_t<yielded>` direct-non-list-initialized with `lval`, whose member functions arrange for *`value_`* to point to that stored object and then suspend the coroutine.

8 *Throws*: Any exception thrown by the initialization of the stored object.

9 *Remarks*: A *yield-expression* that calls this function has type `void` (7.6.17).

```
template<class R2, class V2, class Alloc2, class Unused>
  requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
  auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
template<class R2, class V2, class Alloc2, class Unused>
  requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
  auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&, Unused> g) noexcept;
```

10 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*active_` of some `generator` object `x`. The coroutine referred to by `g.range.coroutine_` is suspended at its initial suspend point.

11 *Returns*: An awaitable object of an unspecified type (7.6.2.4) into which `g.range` is moved, whose member `await_ready` returns `false`, whose member `await_suspend` pushes `g.range.coroutine_` into `*x.active_` and resumes execution of the coroutine referred to by `g.range.coroutine_`, and whose member `await_resume` evaluates `rethrow_exception(except_)` if `bool(except_)` is `true`. If `bool(except_)` is `false`, the `await_resume` member has no effects.

12 *Remarks*: A *yield-expression* that calls one of these functions has type `void` (7.6.17).

```
template<ranges::input_range R, class Alloc>
  requires convertible_to<ranges::range_reference_t<R>, yielded>
  auto yield_value(ranges::elements_of<R, Alloc> r);
```

13 *Effects*: Equivalent to:

```
auto nested = [](allocator_arg_t, Alloc, ranges::iterator_t<R> i, ranges::sentinel_t<R> s)
  -> generator<yielded, void, Alloc> {
    for (; i != s; ++i) {
      co_yield static_cast<yielded>(*i);
    }
  };
return yield_value(ranges::elements_of(nested(
  allocator_arg, r.allocator, ranges::begin(r.range), ranges::end(r.range))));
```

14 [*Note 1*: A *yield-expression* that calls this function has type `void` (7.6.17). — *end note*]

```
void unhandled_exception();
```

15 *Preconditions*: A handle referring to the coroutine whose promise object is `*this` is at the top of `*active_` of some `generator` object `x`.

16 *Effects*: If the handle referring to the coroutine whose promise object is `*this` is the sole element of `*x.active_`, equivalent to `throw`, otherwise, assigns `current_exception()` to `except_`.

```
void* operator new(size_t size)
  requires same_as<Allocator, void> || default_initializable<Allocator>;

template<class Alloc, class... Args>
  void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);

template<class This, class Alloc, class... Args>
  void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                     const Args&...);
```

17 Let `A` be

(17.1) — `Allocator`, if it is not `void`,

(17.2) — `Alloc` for the overloads with a template parameter `Alloc`, or

(17.3) — `allocator<void>` otherwise.

Let `B` be `allocator_traits<A>::template rebind_alloc<U>` where `U` is an unspecified type whose size and alignment are both `__STDCPP_DEFAULT_NEW_ALIGNMENT__`.

18 *Mandates*: `allocator_traits<B>::pointer` is a pointer type. For the overloads with a template parameter `Alloc`, `same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>` is modeled.

19 *Effects*: Initializes an allocator `b` of type `B` with `A(alloc)`, for the overloads with a function parameter `alloc`, and with `A()` otherwise. Uses `b` to allocate storage for the smallest array of `U` sufficient to provide storage for a coroutine state of size `size`, and unspecified additional state necessary to ensure that `operator delete` can later deallocate this memory block with an allocator equal to `b`.

20 *Returns*: A pointer to the allocated storage.

```
void operator delete(void* pointer, size_t size) noexcept;
```

21 *Preconditions*: `pointer` was returned from an invocation of one of the above overloads of `operator new` with a `size` argument equal to `size`.

22 *Effects*: Deallocates the storage pointed to by `pointer` using an allocator equivalent to that used to allocate it.

25.8.6 Class `generator::iterator` [coro.generator.iterator]

```
namespace std {
  template<class Ref, class Val, class Allocator>
  class generator<Ref, Val, Allocator>::iterator {
  public:
    using value_type = value;
    using difference_type = ptrdiff_t;

    iterator(iterator&& other) noexcept;
    iterator& operator=(iterator&& other) noexcept;

    reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
    iterator& operator++();
    void operator++(int);

    friend bool operator==(const iterator& i, default_sentinel_t);

  private:
    coroutine_handle<promise_type> coroutine_; // exposition only
  };
}
```

```
iterator(iterator&& other) noexcept;
```

1 *Effects*: Initializes *coroutine_* with `exchange(other.coroutine_, {})`.

```
iterator& operator=(iterator&& other) noexcept;
```

2 *Effects*: Equivalent to *coroutine_* `= exchange(other.coroutine_, {})`.

3 *Returns*: `*this`.

```
reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
```

4 *Preconditions*: For some `generator` object `x`, *coroutine_* is in `*x.active_` and `x.active_->top()` refers to a suspended coroutine with promise object `p`.

5 *Effects*: Equivalent to: `return static_cast<reference>(*p.value_);`

```
iterator& operator++();
```

6 *Preconditions*: For some `generator` object `x`, *coroutine_* is in `*x.active_`.

7 *Effects*: Equivalent to `x.active_->top().resume()`.

8 *Returns*: `*this`.

```
void operator++(int);
```

9 *Effects*: Equivalent to `++*this`.

```
friend bool operator==(const iterator& i, default_sentinel_t);
```

10 *Effects*: Equivalent to: `return i.coroutine_.done();`

©ISO/IEC

26 Algorithms library [algorithms]

26.1 General [algorithms.general]

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 23) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the C library, as summarized in Table 85.

Table 85 — Algorithms library summary [tab:algorithms.summary]

	Subclause	Header
26.2	Algorithms requirements	
26.3	Parallel algorithms	`<execution>`
26.5	Algorithm result types	`<algorithm>`
26.6	Non-modifying sequence operations	
26.7	Mutating sequence operations	
26.8	Sorting and related operations	
26.10	Generalized numeric operations	`<numeric>`
26.11	Specialized `<memory>` algorithms	`<memory>`
26.12	Specialized `<random>` algorithms	`<random>`
26.13	C library algorithms	`<cstdlib>`

26.2 Algorithms requirements [algorithms.requirements]

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the `std::ranges` namespace in this Clause and specified as function templates are algorithm function objects (16.3.3.4).

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm's *Effects* element specifies that a value pointed to by any iterator passed as an argument is modified, then the type of that argument shall meet the requirements of a mutable iterator (24.3).

(4.2) — If an algorithm's template parameter is named `InputIterator`, `InputIterator1`, or `InputIterator2`, the template argument shall meet the *Cpp17InputIterator* requirements (24.3.5.3).

(4.3) — If an algorithm's template parameter is named `OutputIterator`, `OutputIterator1`, or `OutputIterator2`, the template argument shall meet the *Cpp17OutputIterator* requirements (24.3.5.4).

(4.4) — If an algorithm's template parameter is named `ForwardIterator`, `ForwardIterator1`, `ForwardIterator2`, or `NoThrowForwardIterator`, the template argument shall meet the *Cpp17ForwardIterator* requirements (24.3.5.5) if it is required to be a mutable iterator, or model `forward_iterator` (24.3.4.11) otherwise.

(4.5) — If an algorithm's template parameter is named `NoThrowForwardIterator`, the template argument is also required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.6) — If an algorithm's template parameter is named `BidirectionalIterator`, `BidirectionalIterator1`, or `BidirectionalIterator2`, the template argument shall meet the *Cpp17BidirectionalIterator* requirements (24.3.5.6) if it is required to be a mutable iterator, or model `bidirectional_iterator` (24.3.4.12) otherwise.

©ISO/IEC

(4.7) — If an algorithm's template parameter is named `RandomAccessIterator`, `RandomAccessIterator1`, or `RandomAccessIterator2`, the template argument shall meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) if it is required to be a mutable iterator, or model `random_access_iterator` (24.3.4.13) otherwise.

[*Note 1*: These requirements do not affect iterator arguments that are constrained, for which iterator category and mutability requirements are expressed explicitly. — *end note*]

5 Both in-place and copying versions are provided for certain algorithms.[180] When such a version is provided for *algorithm* it is called *algorithm_copy*. Algorithms that take predicates end with the suffix `_if` (which follows the suffix `_copy`).

6 When not otherwise constrained, the `Predicate` parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as `true`. If an algorithm takes `Predicate pred` as its argument and `first` as its iterator argument with value type `T`, the expression `pred(*first)` shall be well-formed and the type `decltype(pred(*first))` shall model *boolean-testable* (18.5.2). The function object `pred` shall not apply any non-constant function through its argument. Given a glvalue `u` of type (possibly const) `T` that designates the same object as `*first`, `pred(u)` shall be a valid expression that is equal to `pred(*first)`.

7 When not otherwise constrained, the `BinaryPredicate` parameter is used whenever an algorithm expects a function object that, when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature, returns a value testable as `true`. If an algorithm takes `BinaryPredicate binary_pred` as its argument and `first1` and `first2` as its iterator arguments with respective value types `T1` and `T2`, the expression `binary_pred(*first1, *first2)` shall be well-formed and the type `decltype(binary_pred(*first1, *first2))` shall model *boolean-testable*. Unless otherwise specified, `BinaryPredicate` always takes the first iterator's `value_type` as its first argument, that is, in those cases when `T value` is part of the signature, the expression `binary_pred(*first1, value)` shall be well-formed and the type `decltype(binary_pred(*first1, value))` shall model *boolean-testable*. `binary_pred` shall not apply any non-constant function through any of its arguments. Given a glvalue `u` of type (possibly const) `T1` that designates the same object as `*first1`, and a glvalue `v` of type (possibly const) `T2` that designates the same object as `*first2`, `binary_pred(u, *first2)`, `binary_pred(*first1, v)`, and `binary_pred(u, v)` shall each be a valid expression that is equal to `binary_pred(*first1, *first2)`, and `binary_pred(u, value)` shall be a valid expression that is equal to `binary_pred(*first1, value)`.

8 The parameters `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and `BinaryOperation2` are used whenever an algorithm expects a function object (22.10).

9 [*Note 2*: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — *end note*]

10 When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either `true` or `false` in boolean contexts.

11 In the description of the algorithms, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as those of

```
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

Similarly, operator `-` is used for some combinations of iterators and sentinel types for which it does not have to be defined. If [`a`, `b`) denotes a range, the semantics of `b - a` in these cases are the same as those of

```
iter_difference_t<decltype(a)> n = 0;
for (auto tmp = a; tmp != b; ++tmp) ++n;
return n;
```

and if [`b`, `a`) denotes a range, the same as those of

```
iter_difference_t<decltype(b)> n = 0;
for (auto tmp = b; tmp != a; ++tmp) --n;
return n;
```

180) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users can invoke `copy` followed by `sort`.

For each iterator `i` and sentinel `s` produced from a range `r`, the semantics of `s - i` are the same as those of an expression that has the same type, value, and value category as `ranges::distance(i, s)`.

[*Note 3*: The implementation can use `ranges::distance(r)` when that produces the same value as `ranges::distance(i, s)`. This can be more efficient for sized ranges. — *end note*]

12 In the description of the algorithms, given an iterator `a` whose difference type is `D`, and an expression `n` of integer-like type other than *cv* `D`, the semantics of `a + n` and `a - n` are, respectively, those of `a + D(n)` and `a - D(n)`.

13 In the description of algorithm return values, a sentinel value `s` denoting the end of a range [`i`, `s`) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.

14 Overloads of algorithms that take `range` arguments (25.4.2) behave as if they are implemented by dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments, where for each range argument `r`

(14.1) — a corresponding iterator argument is initialized with `ranges::begin(r)` and

(14.2) — a corresponding sentinel argument is initialized with `ranges::end(r)`, or `ranges::next(ranges::begin(r), ranges::end(r))` if the type of `r` models `forward_range` and computing `ranges::next` meets the specified complexity requirements.

15 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[*Note 4*: Consequently, an implementation can declare an algorithm with different template parameters than those presented. — *end note*]

26.3 Parallel algorithms [algorithms.parallel]

26.3.1 Preamble [algorithms.parallel.defns]

1 Subclause 26.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

2 A *parallel algorithm* is a function template listed in this document with a template parameter named `ExecutionPolicy` or constrained by the following exposition-only concept:

```
template<class Ep>
  concept execution-policy = is_execution_policy_v<remove_cvref_t<Ep>>;      // exposition only
```

Such a template parameter is termed an *execution policy template parameter*.

3 A parallel algorithm accesses objects indirectly accessible via its arguments by invoking the following functions:

(3.1) — All operations of the categories of the iterators, sentinels, or `mdspan` types that the algorithm is instantiated with.

(3.2) — Operations on those sequence elements that are required by its specification.

(3.3) — User-provided invocable objects to be applied during the execution of the algorithm, if required by the specification.

(3.4) — Operations on those invocable objects required by the specification.

[*Note 1*: See 26.2. — *end note*]

These functions are herein called *element access functions*.

4 [*Example 1*: The `sort` function may invoke the following element access functions:

(4.1) — Operations of the random-access iterator of the actual template argument (as per 24.3.5.7), as implied by the name of the template parameter `RandomAccessIterator`.

(4.2) — The `swap` function on the elements of the sequence (as per the preconditions specified in 26.8.2.1).

(4.3) — The user-provided `Compare` function object.

— *end example*]

5 A standard library function is *vectorization-unsafe* if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function or lock-free atomic modify-write operation (32.5.4).

[*Note 2*: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — *end note*]

[*Example 2*:

```
int x = 0;
std::mutex m;
void f() {
  int a[] = {1,2};
  std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);            // incorrect: lock_guard constructor calls m.lock()
    ++x;
  });
}
```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — *end example*]

26.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

1 Unless otherwise specified, invocable objects passed into parallel algorithms as objects of a type denoted by a template parameter named `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, `BinaryDivideOp`, or constrained by a concept whose semantic requirements include that the type models `regular_invocable` and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

26.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

1 An execution policy template parameter describes the manner in which the execution of a parallel algorithm may be parallelized and the manner in which it applies the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[*Note 1*: For example, `swap`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — *end note*]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`.

[*Note 2*: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — *end note*]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

[*Note 3*: The invocations are not interleaved; see 6.10.1. — *end note*]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[*Note 4*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.10.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::unsequenced_policy` algorithm.

[*Note 5*: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the

threads of execution created by `thread` (32.4.3) or `jthread` (32.4.4) provide concurrent forward progress guarantees (6.10.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[*Note 6*: It is the caller's responsibility to ensure that the invocation does not introduce data races or deadlocks. — *end note*]

[*Example 1*:

```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
  v.push_back(i*2+1);                    // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — *end example*]

[*Example 2*:

```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  x.fetch_add(1, std::memory_order::relaxed);
  // spin wait for another iteration to change the value of x
  while (x.load(std::memory_order::relaxed) == 1) { }          // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — *end example*]

[*Example 3*:

```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  std::lock_guard<mutex> guard(m);
  ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — *end example*]

7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

[*Note 7*: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.10.1 that function executions do not overlap with one another. — *end note*]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from an `execution::parallel_unsequenced_policy` algorithm.

[*Note 8*: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — *end note*]

8 [*Note 9*: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — *end note*]

9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

(9.1) — temporarily block with forward progress guarantee delegation (6.10.2.3) on the completion of these library-managed threads of execution, or

(9.2) — eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

[*Note 10*: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — *end note*]

10 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

26.3.4 Parallel algorithm exceptions [algorithms.parallel.exceptions]

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the execution policy.

26.3.5 Parallel algorithm overloads [algorithms.parallel.overloads]

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional function parameter P of type `T&&` as the first function parameter, where `T` is the execution policy template parameter.

[*Note 1*: Not all algorithms have parallel algorithm overloads. — *end note*]

2 Unless otherwise specified, the semantics of calling a parallel algorithm overload are identical to calling the corresponding algorithm overload without the parameter P, using all but the first argument.

3 Unless otherwise specified, the complexity requirements of a parallel algorithm overload are relaxed from the complexity requirements of the corresponding overload without the parameter P as follows: when the guarantee says "at most *expr*" or "exactly *expr*" and does not specify the number of assignments or swaps, and *expr* is not already expressed with $\mathit{O}()$ notation, the complexity of the algorithm shall be $\mathit{O}(expr)$.

4 A parallel algorithm with a template parameter named `ExecutionPolicy` shall not participate in overload resolution unless that template parameter satisfies *`execution-policy`*.

26.3.6 Execution policies [execpol]

26.3.6.1 General [execpol.general]

1 Subclause 26.3.6 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. Execution policy types are declared in header `<execution>` (33.4).

[*Example 1*:

```
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```

— *end example*]

[*Note 1*: Implementations can provide additional execution policies to those described in this document as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — *end note*]

26.3.6.2 Execution policy type trait [execpol.type]

```
template<class T> struct is_execution_policy;
```

1 `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

2 `is_execution_policy<T>` is a *Cpp17UnaryTypeTrait* with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[*Note 1*: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — *end note*]

3 The behavior of a program that adds specializations for `is_execution_policy` is undefined.

26.3.6.3 Sequenced execution policy [execpol.seq]

```
class execution::sequenced_policy { unspecified };
```

1 The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm's execution may not be parallelized.

2 During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.4 Parallel execution policy [execpol.par]

```
class execution::parallel_policy { unspecified };
```

1 The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized.

2 During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.5 Parallel and unsequenced execution policy [execpol.parunseq]

```
class execution::parallel_unsequenced_policy { unspecified };
```

1 The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be parallelized and vectorized.

2 During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.6 Unsequenced execution policy [execpol.unseq]

```
class execution::unsequenced_policy { unspecified };
```

1 The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm's execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

2 During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

26.3.6.7 Execution policy objects [execpol.objects]

```
inline constexpr execution::sequenced_policy           execution::seq{ unspecified };
inline constexpr execution::parallel_policy            execution::par{ unspecified };
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };
inline constexpr execution::unsequenced_policy         execution::unseq{ unspecified };
```

1 The header `<execution>` (33.4) declares global objects associated with each type of execution policy.

26.4 Header `<algorithm>` synopsis [algorithm.syn]

```
// mostly freestanding
#include <initializer_list>      // see 17.11.2

namespace std {

  template<class O2, class T2>
    requires convertible_to<const O&, O2> && convertible_to<const T&, T2>
  constexpr operator out_value_result<O2, T2>() const & {
    return {out, value};
  }
```

```
    template<class O2, class T2>
      requires convertible_to<O, O2> && convertible_to<T, T2>
    constexpr operator out_value_result<O2, T2>() && {
      return {std::move(out), std::move(value)};
    }
  };
}
```

26.6 Non-modifying sequence operations [alg.nonmodifying]

26.6.1 All of [alg.all.of]

```
template<class InputIterator, class Predicate>
  constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  bool ranges::all_of(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  bool ranges::all_of(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `false` for some iterator `i` in the range [`first`, `last`), and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.2 Any of [alg.any.of]

```
template<class InputIterator, class Predicate>
  constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  bool ranges::any_of(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  bool ranges::any_of(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `true` if E is `true` for some iterator `i` in the range [`first`, `last`), and `false` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.3 None of [alg.none.of]

```
template<class InputIterator, class Predicate>
  constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  bool ranges::none_of(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  bool ranges::none_of(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `pred(*i)` for the overloads in namespace `std`;

(1.2) — `invoke(pred, invoke(proj, *i))` for the overloads in namespace `ranges`.

2 *Returns*: `false` if E is `true` for some iterator `i` in the range [`first`, `last`), and `true` otherwise.

3 *Complexity*: At most `last - first` applications of the predicate and any projection.

26.6.4 Contains [alg.contains]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr bool ranges::contains(I first, S last, const T& value, Proj proj = {});
template<input_range R, class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr bool ranges::contains(R&& r, const T& value, Proj proj = {});
```

1 *Returns*: `ranges::find(std::move(first), last, value, proj) != last`.

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  bool ranges::contains(Ep&& exec, I first, S last, const T& value, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires
    indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  bool ranges::contains(Ep&& exec, R&& r, const T& value, Proj proj = {});
```

2 *Returns*: `ranges::find(std::forward<Ep>(exec), first, last, value, proj) != last`.

```
template<forward_iterator I1, sentinel_for<I1> S1,
         forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::contains_subrange(I1 first1, S1 last1, I2 first2, S2 last2,
                                           Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::contains_subrange(R1&& r1, R2&& r2, Pred pred = {},
                                           Proj1 proj1 = {}, Proj2 proj2 = {});
```

3 *Returns*:

```
first2 == last2 || !ranges::search(first1, last1, first2, last2,
                                   pred, proj1, proj2).empty()
```

```
template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  bool ranges::contains_subrange(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2,
                                 Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  bool ranges::contains_subrange(Ep&& exec, R1&& r1, R2&& r2, Pred pred = {},
                                 Proj1 proj1 = {}, Proj2 proj2 = {});
```

4 *Returns*:

```
first2 == last2 || !ranges::search(std::forward<Ep>(exec), first1, last1,
                                   first2, last2, pred, proj1, proj2).empty()
```

26.6.5 For each [alg.foreach]

```
template<class InputIterator, class Function>
  constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

1 *Preconditions*: `Function` meets the *Cpp17MoveConstructible* requirements (Table 31).

[*Note 1*: `Function` need not meet the requirements of *Cpp17CopyConstructible* (Table 32). — *end note*]

2 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `last`), starting from `first` and proceeding to `last - 1`.

[*Note 2*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

3 *Returns*: `f`.

4 *Complexity*: Applies `f` exactly `last - first` times.

5 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Function>
  void for_each(ExecutionPolicy&& exec,
                ForwardIterator first, ForwardIterator last,
                Function f);
```

6 *Preconditions*: `Function` meets the *Cpp17CopyConstructible* requirements.

7 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `last`).

[*Note 3*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

8 *Complexity*: Applies `f` exactly `last - first` times.

9 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

10 [*Note 4*: Does not return a copy of its `Function` parameter, since parallelization often does not permit efficient state accumulation. — *end note*]

```
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_result<I, Fun>
    ranges::for_each(I first, S last, Fun f, Proj proj = {});
```

```
template<input_range R, class Proj = identity,
         indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
  constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
    ranges::for_each(R&& r, Fun f, Proj proj = {});
```

11 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`, `last`), starting from `first` and proceeding to `last - 1`.

[*Note 5*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

12 *Returns*: `{last, std::move(f)}`.

13 *Complexity*: Applies `f` and `proj` exactly `last - first` times.

14 *Remarks*: If `f` returns a result, the result is ignored.

15 [*Note 6*: The overloads in namespace `ranges` require `Fun` to model `copy_constructible`. — *end note*]

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  I ranges::for_each(Ep&& exec, I first, S last, Fun f, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
  borrowed_iterator_t<R>
    ranges::for_each(Ep&& exec, R&& r, Fun f, Proj proj = {});
```

16 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`, `last`).

[*Note 7*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

17 *Returns*: `last`.

18 *Complexity*: Applies `f` and `proj` exactly `last - first` times.

19 *Remarks*:

(19.1) — If `f` returns a result, the result is ignored.

(19.2) — Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

(19.3) — `f` may modify objects via its arguments (26.3.2).

[*Note 8*: Does not return a copy of its `Fun` parameter, since parallelization often does not permit efficient state accumulation. — *end note*]

```
template<class InputIterator, class Size, class Function>
  constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);
```

20 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

21 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17MoveConstructible* requirements.

[*Note 9*: `Function` need not meet the requirements of *Cpp17CopyConstructible*. — *end note*]

22 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `first + n`) in order.

[*Note 10*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

23 *Returns*: `first + n`.

24 *Remarks*: If `f` returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
  ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
                             Function f);
```

25 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

26 *Preconditions*: `n >= 0` is `true`. `Function` meets the *Cpp17CopyConstructible* requirements.

27 *Effects*: Applies `f` to the result of dereferencing every iterator in the range [`first`, `first + n`).

[*Note 11*: If the type of `first` meets the requirements of a mutable iterator, `f` can apply non-constant functions through the dereferenced iterator. — *end note*]

28 *Returns*: `first + n`.

29 *Remarks*: If `f` returns a result, the result is ignored. Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  constexpr ranges::for_each_n_result<I, Fun>
    ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

30 *Preconditions*: `n >= 0` is `true`.

31 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`,`first + n`) in order.

[*Note 12*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

32 *Returns*: `{first + n, std::move(f)}`.

33 *Remarks*: If `f` returns a result, the result is ignored.

34 [*Note 13*: The overload in namespace `ranges` requires `Fun` to model `copy_constructible`. — *end note*]

```
template<execution-policy Ep, random_access_iterator I, class Proj = identity,
         indirectly_unary_invocable<projected<I, Proj>> Fun>
  I ranges::for_each_n(Ep&& exec, I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

35 *Preconditions*: `n >= 0` is `true`.

36 *Effects*: Calls `invoke(f, invoke(proj, *i))` for every iterator `i` in the range [`first`,`first + n`).

[*Note 14*: If the result of `invoke(proj, *i)` is a mutable reference, `f` can apply non-constant functions. — *end note*]

37 *Returns*: `first + n`.

38 *Remarks*:

(38.1) — If `f` returns a result, the result is ignored.

(38.2) — Implementations do not have the freedom granted under 26.3.3 to make arbitrary copies of elements from the input sequence.

(38.3) — `f` may modify objects via its arguments (26.3.2).

[*Note 15*: Does not return a copy of its `Fun` parameter, since parallelization often does not permit efficient state accumulation. — *end note*]

26.6.6 Find [alg.find]

```
template<class InputIterator, class T = iterator_traits<InputIterator>::value_type>
  constexpr InputIterator find(InputIterator first, InputIterator last,
                               const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                       const T& value);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if(InputIterator first, InputIterator last,
                                  Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                          Predicate pred);

template<class InputIterator, class Predicate>
  constexpr InputIterator find_if_not(InputIterator first, InputIterator last,
                                      Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator find_if_not(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>

template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  borrowed_iterator_t<R> ranges::find_if_not(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for `find`;

(1.2) — `pred(*i) != false` for `find_if`;

(1.3) — `pred(*i) == false` for `find_if_not`;

(1.4) — `bool(invoke(proj, *i) == value)` for `ranges::find`;

(1.5) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::find_if`;

(1.6) — `bool(!invoke(pred, invoke(proj, *i)))` for `ranges::find_if_not`.

2 *Returns*: The first iterator `i` in the range [`first`, `last`) for which E is `true`. Returns `last` if no such iterator is found.

3 *Complexity*: At most `last - first` applications of the corresponding predicate and any projection.

26.6.7 Find last [alg.find.last]

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr subrange<I> ranges::find_last(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr borrowed_subrange_t<R> ranges::find_last(R&& r, const T& value, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  subrange<I> ranges::find_last(Ep&& exec, I first, S last, const T& value, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,

  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  borrowed_iterator_t<R1>
    ranges::find_first_of(Ep&& exec, R1&& r1, R2&& r2, Pred pred = {},
                          Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let E be:

(1.1) — `*i == *j` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *j) != false` for the overloads with a parameter `pred` and no parameter `proj1`;

(1.3) — `bool(invoke(pred, invoke(proj1, *i), invoke(proj2, *j)))` for the overloads with parameters `pred` and `proj1`.

2 *Effects*: Finds an element that matches one of a set of values.

3 *Returns*: The first iterator `i` in the range [`first1`, `last1`) such that for some iterator `j` in the range [`first2`, `last2`) E holds. Returns `last1` if [`first2`, `last2`) is empty or if no such iterator is found.

4 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and any projections.

26.6.10 Adjacent find [alg.adjacent.find]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
  constexpr ForwardIterator
    adjacent_find(ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
  ForwardIterator
    adjacent_find(ExecutionPolicy&& exec,
                  ForwardIterator first, ForwardIterator last,
                  BinaryPredicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_binary_predicate<projected<I, Proj>,
                                   projected<I, Proj>> Pred = ranges::equal_to>
  constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_binary_predicate<projected<iterator_t<R>, Proj>,
                                   projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
  constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_binary_predicate<projected<I, Proj>,
                                   projected<I, Proj>> Pred = ranges::equal_to>
  I ranges::adjacent_find(Ep&& exec, I first, S last, Pred pred = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_binary_predicate<projected<iterator_t<R>, Proj>,
                                   projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
  borrowed_iterator_t<R>
    ranges::adjacent_find(Ep&& exec, R&& r, Pred pred = {}, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == *(i + 1)` for the overloads with no parameter `pred`;

(1.2) — `pred(*i, *(i + 1)) != false` for the overloads with a parameter `pred` and no parameter `proj`;

(1.3) — `bool(invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))))` for the overloads with both parameters `pred` and `proj`.

2 *Returns*: The first iterator `i` such that both `i` and `i + 1` are in the range [`first`, `last`) for which E holds. Returns `last` if no such iterator is found.

3 *Complexity*: For the non-parallel algorithm overloads, exactly

$$\min((\texttt{i - first}) + 1, (\texttt{last - first}) - 1)$$

applications of the corresponding predicate, where `i` is `adjacent_find`'s return value. For the parallel algorithm overloads, O(`last - first`) applications of the corresponding predicate. No more than twice as many applications of any projection.

26.6.11 Count [alg.count]

```
template<class InputIterator, class T = iterator_traits<InputIterator>::value_type>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count(InputIterator first, InputIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  typename iterator_traits<ForwardIterator>::difference_type
    count(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
  constexpr typename iterator_traits<InputIterator>::difference_type
    count_if(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  typename iterator_traits<ForwardIterator>::difference_type
    count_if(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  constexpr iter_difference_t<I>
    ranges::count(I first, S last, const T& value, Proj proj = {});
template<input_range R, class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
  constexpr range_difference_t<R>
    ranges::count(R&& r, const T& value, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, class T = projected_value_t<I, Proj>>
  requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
  iter_difference_t<I>
    ranges::count(Ep&& exec, I first, S last, const T& value, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirect_binary_predicate<ranges::equal_to,
                                     projected<iterator_t<R>, Proj>, const T*>
  range_difference_t<R> ranges::count(Ep&& exec, R&& r, const T& value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr iter_difference_t<I>
    ranges::count_if(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr range_difference_t<R>
    ranges::count_if(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  iter_difference_t<I>
    ranges::count_if(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  range_difference_t<R>
    ranges::count_if(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E be:

(1.1) — `*i == value` for the overloads with no parameter `pred` or `proj`;

(1.2) — `pred(*i) != false` for the overloads with a parameter `pred` but no parameter `proj`;

(1.3) — `invoke(proj, *i) == value` for the overloads with a parameter `proj` but no parameter `pred`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads with both parameters `proj` and `pred`.

2 *Effects*: Returns the number of iterators `i` in the range [`first`, `last`) for which E holds.

3 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

26.6.12 Mismatch [alg.mismatch]

```
template<class InputIterator1, class InputIterator2>
  constexpr pair<InputIterator1, InputIterator2>
    mismatch(InputIterator1 first1, InputIterator1 last1,
             InputIterator2 first2);

  bool ranges::equal(Ep&& exec, R1&& r1, R2&& r2,
                     Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads in namespace `std` with no parameter `last2`;

(1.2) — `pred` be `equal_to{}` for the overloads with no parameter `pred`;

(1.3) — E be:

(1.3.1) — `pred(*i, *(first2 + (i - first1)))` for the overloads with no parameter `proj1`;

(1.3.2) — `invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1))))` for the overloads with parameter `proj1`.

2 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if E holds for every iterator `i` in the range [`first1`, `last1`). Otherwise, returns `false`.

3 *Complexity*: If

(3.1) — the types of `first1`, `last1`, `first2`, and `last2` meet the *Cpp17RandomAccessIterator* requirements (24.3.5.7) and `last1 - first1 != last2 - first2` for the overloads in namespace `std`;

(3.2) — the types of `first1`, `last1`, `first2`, and `last2` pairwise model `sized_sentinel_for` (24.3.4.8) and `last1 - first1 != last2 - first2` for the first and third overloads in namespace `ranges`, or

(3.3) — `R1` and `R2` each model `sized_range` and `ranges::distance(r1) != ranges::distance(r2)` for the second and fourth overloads in namespace `ranges`,

then no applications of the corresponding predicate and each projection; otherwise, at most

$$\min(\texttt{last1 - first1}, \texttt{last2 - first2})$$

applications of the corresponding predicate and any projections.

26.6.14 Is permutation [alg.is.permutation]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, BinaryPredicate pred);
template<class ForwardIterator1, class ForwardIterator2>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2,
                                BinaryPredicate pred);
```

1 Let `last2` be `first2 + (last1 - first1)` for the overloads with no parameter named `last2`, and let `pred` be `equal_to{}` for the overloads with no parameter `pred`.

2 *Mandates*: `ForwardIterator1` and `ForwardIterator2` have the same value type.

3 *Preconditions*: The comparison function is an equivalence relation.

4 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range [`first2`, `last2`), beginning with `ForwardIterator2 begin`, such that `equal(first1, last1, begin, pred)` returns `true`; otherwise, returns `false`.

5 *Complexity*: No applications of the corresponding predicate if `ForwardIterator1` and `ForwardIterator2` meet the requirements of random access iterators and `last1 - first1 != last2 - first2`. Otherwise, exactly `last1 - first1` applications of the corresponding predicate if `equal(first1, last1, first2, last2, pred)` would return `true`; otherwise, at worst $\mathcal{O}(N^2)$, where N has the value `last1 - first1`.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<I1, Proj1>,
                                       projected<I2, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
                                        Pred pred = {},
                                        Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_equivalence_relation<projected<iterator_t<R1>, Proj1>,
                                       projected<iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
  constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {},
                                        Proj1 proj1 = {}, Proj2 proj2 = {});
```

6 *Returns*: If `last1 - first1 != last2 - first2`, return `false`. Otherwise return `true` if there exists a permutation of the elements in the range [`first2`, `last2`), bounded by [`pfirst`, `plast`), such that `ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2)` returns `true`; otherwise, returns `false`.

7 *Complexity*: No applications of the corresponding predicate and projections if

(7.1) — for the first overload,

(7.1.1) — `S1` and `I1` model `sized_sentinel_for<S1, I1>`,

(7.1.2) — `S2` and `I2` model `sized_sentinel_for<S2, I2>`, and

(7.1.3) — `last1 - first1 != last2 - first2`;

(7.2) — for the second overload, `R1` and `R2` each model `sized_range`, and `ranges::distance(r1) != ranges::distance(r2)`.

Otherwise, exactly `last1 - first1` applications of the corresponding predicate and projections if `ranges::equal(first1, last1, first2, last2, pred, proj1, proj2)` would return `true`; otherwise, at worst $\mathcal{O}(N^2)$, where N has the value `last1 - first1`.

26.6.15 Search [alg.search]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
  ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);
```

1 *Returns*: The first iterator `i` in the range [`first1`, `last1 - (last2 - first2)`] such that for every non-negative integer `n` less than `last2 - first2` the following corresponding conditions hold: `*(i + n) == *(first2 + n)`, `pred(*(i + n), *(first2 + n)) != false`. Returns `first1` if [`first2`, `last2`) is empty, otherwise returns `last1` if no such iterator is found.

2 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate.

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2,
         sentinel_for<I2> S2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr subrange<I1>
    ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});
template<forward_range R1, forward_range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr borrowed_subrange_t<R1>
    ranges::search(R1&& r1, R2&& r2, Pred pred = {},
                   Proj1 proj1 = {}, Proj2 proj2 = {});

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  subrange<I1>
    ranges::search(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2,
                   Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  borrowed_subrange_t<R1>
    ranges::search(Ep&& exec, R1&& r1, R2&& r2,
                   Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

3 *Returns*:

(3.1) — `{i, i + (last2 - first2)}`, where `i` is the first iterator in the range [`first1`, `last1 - (last2 - first2)`] such that for every non-negative integer `n` less than `last2 - first2` the condition

`bool(invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))))`

is `true`.

(3.2) — Returns `{last1, last1}` if no such iterator exists.

4 *Complexity*: At most `(last1 - first1) * (last2 - first2)` applications of the corresponding predicate and projections.

```
template<class ForwardIterator, class Size, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value);

template<class ForwardIterator, class Size, class T = iterator_traits<ForwardIterator>::value_type,
         class BinaryPredicate>
  constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type,
         class BinaryPredicate>
  ForwardIterator
    search_n(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Size count, const T& value,
             BinaryPredicate pred);
```

5 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

6 Let E be `pred(*(i + n), value) != false` for the overloads with a parameter `pred`, and `*(i + n) == value` otherwise.

7 *Returns*: The first iterator `i` in the range [`first`, `last - count`] such that for every non-negative integer `n` less than `count` the condition E is `true`. Returns `last` if no such iterator is found.

8 *Complexity*: At most `last - first` applications of the corresponding predicate.

```
template<forward_iterator I, sentinel_for<I> S,
         class Pred = ranges::equal_to, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirectly_comparable<I, const T*, Pred, Proj>
  constexpr subrange<I>
    ranges::search_n(I first, S last, iter_difference_t<I> count,
                     const T& value, Pred pred = {}, Proj proj = {});
template<forward_range R, class Pred = ranges::equal_to,
         class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
  constexpr borrowed_subrange_t<R>
    ranges::search_n(R&& r, range_difference_t<R> count,
                     const T& value, Pred pred = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Pred = ranges::equal_to, class Proj = identity,
         class T = projected_value_t<I, Proj>>
  requires indirectly_comparable<I, const T*, Pred, Proj>
  subrange<I>
    ranges::search_n(Ep&& exec, I first, S last, iter_difference_t<I> count,
                     const T& value, Pred pred = {}, Proj proj = {});
```

©ISO/IEC

```
template<execution-policy Ep, sized-random-access-range R, class Pred = ranges::equal_to,
         class Proj = identity, class T = projected_value_t<iterator_t<R>, Proj>>
  requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
  borrowed_subrange_t<R>
    ranges::search_n(Ep&& exec, R&& r, range_difference_t<R> count,
                     const T& value, Pred pred = {}, Proj proj = {});
```

9 *Returns*: `{i, i + count}` where `i` is the first iterator in the range [`first`,`last - count`] such that for every non-negative integer `n` less than `count`, the following condition holds: `invoke(pred, invoke(proj, *(i + n)), value)`. Returns `{last, last}` if no such iterator is found.

10 *Complexity*: At most `last - first` applications of the corresponding predicate and projection.

```
template<class ForwardIterator, class Searcher>
  constexpr ForwardIterator
    search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);
```

11 *Effects*: Equivalent to: `return searcher(first, last).first;`

12 *Remarks*: `Searcher` need not meet the *Cpp17CopyConstructible* requirements.

26.6.16 Starts with [alg.starts.with]

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {},
                                     Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns*:

```
ranges::mismatch(std::move(first1), last1, std::move(first2), last2,
                 pred, proj1, proj2).in2 == last2
```

```
template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  bool ranges::starts_with(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2,
                           Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1,
         sized-random-access-range R2, class Pred = ranges::equal_to,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  bool ranges::starts_with(Ep&& exec, R1&& r1, R2&& r2,
                           Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

2 *Returns*:

```
ranges::mismatch(std::forward<Ep>(exec), std::move(first1), last1, std::move(first2),
                 last2, pred, proj1, proj2).in2 == last2
```

26.6.17 Ends with [alg.ends.with]

```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
           (forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
           indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `N1` be `last1 - first1` and `N2` be `last2 - first2`.

2 *Returns*: `false` if `N1` $<$ `N2`, otherwise:

```
      ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2,
                    pred, proj1, proj2)
```

```
template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,

```

7 Let N1 be `ranges::distance(r1)` and N2 be `ranges::distance(r2)`.

8 *Returns*: `false` if N1 < N2, otherwise:

```
      ranges::equal(std::forward<Ep>(exec),
                    views::drop(ranges::ref_view(r1), N1 - static_cast<decltype(N1)>(N2)),
                    r2, pred, proj1, proj2)
```

26.6.18 Fold [alg.fold]

```
template<input_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-left-foldable<T, I> F>
  constexpr auto ranges::fold_left(I first, S last, T init, F f);
template<input_range R, class T = range_value_t<R>,
         indirectly-binary-left-foldable<T, iterator_t<R>> F>
  constexpr auto ranges::fold_left(R&& r, T init, F f);
```

1 *Returns*:

```
      ranges::fold_left_with_iter(std::move(first), last, std::move(init), f).value
```

```
template<input_iterator I, sentinel_for<I> S,
         indirectly-binary-left-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr auto ranges::fold_left_first(I first, S last, F f);
template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr auto ranges::fold_left_first(R&& r, F f);
```

2 *Returns*:

```
      ranges::fold_left_first_with_iter(std::move(first), last, f).value
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-right-foldable<T, I> F>
  constexpr auto ranges::fold_right(I first, S last, T init, F f);
template<bidirectional_range R, class T = range_value_t<R>,
         indirectly-binary-right-foldable<T, iterator_t<R>> F>
  constexpr auto ranges::fold_right(R&& r, T init, F f);
```

3 *Effects*: Equivalent to:

```
using U = decay_t<invoke_result_t<F&, iter_reference_t<I>, T>>;
if (first == last)
  return U(std::move(init));
I tail = ranges::next(first, last);
U accum = invoke(f, *--tail, std::move(init));
while (first != tail)
  accum = invoke(f, *--tail, std::move(accum));
return accum;
```

```
template<bidirectional_iterator I, sentinel_for<I> S,
         indirectly-binary-right-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr auto ranges::fold_right_last(I first, S last, F f);
template<bidirectional_range R,
         indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr auto ranges::fold_right_last(R&& r, F f);
```

4 Let `U` be `decltype(ranges::fold_right(first, last, iter_value_t<I>(*first), f))`.

5 *Effects*: Equivalent to:

```
if (first == last)
  return optional<U>();
I tail = ranges::prev(ranges::next(first, std::move(last)));
return optional<U>(in_place,
  ranges::fold_right(std::move(first), tail, iter_value_t<I>(*tail), std::move(f)));
```

```
template<input_iterator I, sentinel_for<I> S, class T = iter_value_t<I>,
         indirectly-binary-left-foldable<T, I> F>
  constexpr see below ranges::fold_left_with_iter(I first, S last, T init, F f);
template<input_range R, class T = range_value_t<R>,
         indirectly-binary-left-foldable<T, iterator_t<R>> F>
  constexpr see below ranges::fold_left_with_iter(R&& r, T init, F f);
```

6 Let `U` be `decay_t<invoke_result_t<F&, T, iter_reference_t<I>>>`.

7 *Effects*: Equivalent to:

```
if (first == last)
  return {std::move(first), U(std::move(init))};
U accum = invoke(f, std::move(init), *first);
for (++first; first != last; ++first)
  accum = invoke(f, std::move(accum), *first);
return {std::move(first), std::move(accum)};
```

8 *Remarks*: The return type is `fold_left_with_iter_result<I, U>` for the first overload and `fold_left_with_iter_result<borrowed_iterator_t<R>, U>` for the second overload.

```
template<input_iterator I, sentinel_for<I> S,
         indirectly-binary-left-foldable<iter_value_t<I>, I> F>
  requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
  constexpr see below ranges::fold_left_first_with_iter(I first, S last, F f);
template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
  requires constructible_from<range_value_t<R>, range_reference_t<R>>
  constexpr see below ranges::fold_left_first_with_iter(R&& r, F f);
```

9 Let `U` be

```
decltype(ranges::fold_left(std::move(first), last, iter_value_t<I>(*first), f))
```

10 *Effects*: Equivalent to:

```
  if (first == last)
    return {std::move(first), optional<U>()};
  optional<U> init(in_place, *first);
  for (++first; first != last; ++first)
    *init = invoke(f, std::move(*init), *first);
  return {std::move(first), std::move(init)};
```

11 *Remarks*: The return type is `fold_left_first_with_iter_result<I, optional<U>>` for the first overload and `fold_left_first_with_iter_result<borrowed_iterator_t<R>, optional<U>>` for the second overload.

26.7 Mutating sequence operations [alg.modifying.operations]

26.7.1 Copy [alg.copy]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator copy(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);
```

1 Let N be `last - first`.

2 *Preconditions*: `result` is not in the range [`first`, `last`).

3 *Effects*: Copies elements in the range [`first`, `last`) into the range [`result`, `result + N`) starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result + n) = *(first + n)`.

4 *Returns*:

(4.1) — `result + N` for the overload in namespace `std`.

(4.2) — `{last, result + N}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 copy(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O, sized_sentinel_for<O> OutS>
  requires indirectly_copyable<I, O>
  ranges::copy_result<I, O>
    ranges::copy(Ep&& exec, I first, S last, O result, OutS result_last);
template<execution-policy Ep, sized-random-access-range R, sized-random-access-range OutR>
  requires indirectly_copyable<iterator_t<R>, iterator_t<OutR>>
  ranges::copy_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR>>
    ranges::copy(Ep&& exec, R&& r, OutR&& result_r);
```

6 Let `result_last` be `result + (last - first)` for the overload in namespace `std`.

7 Let N be min(`last - first`, `result_last - result`).

8 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

9 *Effects*: Copies elements in the range [`first`, `first + N`) into the range [`result`, `result + N`). For each non-negative integer $n < N$, performs `*(result + n) = *(first + n)`.

10 *Returns*:

(10.1) — `result + N` for the overload in namespace `std`.

(10.2) — `{first + N, result + N}` for the overloads in namespace `ranges`.

11 *Complexity*: Exactly N assignments.

```
template<class InputIterator, class Size, class OutputIterator>
  constexpr OutputIterator copy_n(InputIterator first, Size n,
                                  OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
  ForwardIterator2 copy_n(ExecutionPolicy&& exec,
                          ForwardIterator1 first, Size n,
                          ForwardIterator2 result);

template<input_iterator I, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_n_result<I, O>
    ranges::copy_n(I first, iter_difference_t<I> n, O result);

template<execution-policy Ep, random_access_iterator I, random_access_iterator O,
         sized_sentinel_for<O> OutS>
  requires indirectly_copyable<I, O>
  ranges::copy_n_result<I, O>
    ranges::copy_n(Ep&& exec, I first, iter_difference_t<I> n, O result, OutS result_last);
```

12 Let M be $\max(0,$ `n`$)$.

13 Let `result_last` be `result +` M for the overloads with no parameter `result_last`.

14 Let N be $\min($`result_last - result`$, M)$.

15 *Mandates*: The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

16 *Effects*: For each non-negative integer $i < N$, performs `*(result +` i`) = *(first +` i`)`.

17 *Returns*:

(17.1) — `result +` N for the overloads in namespace `std`.

(17.2) — `{first +` N`, result +` N`}` for the overload in namespace `ranges`.

18 *Complexity*: Exactly N assignments.

```
template<class InputIterator, class OutputIterator, class Predicate>
  constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
                                   OutputIterator result, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Predicate>
  ForwardIterator2 copy_if(ExecutionPolicy&& exec,
                           ForwardIterator1 first, ForwardIterator1 last,
                           ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  constexpr ranges::copy_if_result<I, O>
    ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});
template<input_range R, weakly_incrementable O, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O>
    ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O, sized_sentinel_for<O> OutS,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O>
  ranges::copy_if_result<I, O>
    ranges::copy_if(Ep&& exec, I first, S last, O result, OutS result_last,
                    Pred pred, Proj proj = {});
```

```
template<execution-policy Ep, sized-random-access-range R, sized-random-access-range OutR,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, iterator_t<OutR>>
  ranges::copy_if_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR>>
    ranges::copy_if(Ep&& exec, R&& r, OutR&& result_r, Pred pred, Proj proj = {});
```

19 Let E(i) be:

(19.1) — `bool(pred(*i))` for the overloads in namespace `std`;

(19.2) — `bool(invoke(pred, invoke(proj, *i)))` for the overloads in namespace `ranges`.

20 Let:

(20.1) — M be the number of iterators `i` in the range [`first`, `last`) for which the condition E(`i`) holds;

(20.2) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(20.3) — N be min(M, `result_last - result`).

21 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result +` N) do not overlap.

[*Note 1*: For the parallel algorithm overload in namespace `std`, there can be a performance cost if `iterator_traits<ForwardIterator1>::value_type` does not meet the *Cpp17MoveConstructible* (Table 31) requirements. For the parallel algorithm overloads in namespace `ranges`, there can be a performance cost if `iter_value_t<I>` does not model `move_constructible`. — *end note*]

22 *Effects*: Copies the first N elements referred to by the iterator `i` in the range [`first`, `last`) for which E(`i`) is `true` into the range [`result`, `result +` N).

23 *Returns*:

(23.1) — `result +` N for the overloads in namespace `std`.

(23.2) — `{last, result +` N`}` for the overloads in namespace `ranges`, if N is equal to M.

(23.3) — Otherwise, `{j, result_last}` for the overloads in namespace `ranges`, where `j` is the iterator in [`first`, `last`) for which E(`j`) holds and there are exactly N iterators `i` in [`first`, `j`) for which E(`i`) holds.

24 *Complexity*: At most `last - first` applications of the corresponding predicate and any projection.

25 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    copy_backward(BidirectionalIterator1 first,
                  BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_copyable<I1, I2>
  constexpr ranges::copy_backward_result<I1, I2>
    ranges::copy_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_copyable<iterator_t<R>, I>
  constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I>
    ranges::copy_backward(R&& r, I result);
```

26 Let N be `last - first`.

27 *Preconditions*: `result` is not in the range (`first`, `last`].

28 *Effects*: Copies elements in the range [`first`, `last`) into the range [`result -` N, `result`) starting from `last - 1` and proceeding to `first`.[181] For each positive integer $n \leq N$, performs `*(result -` n`) = *(last -` n`)`.

29 *Returns*:

(29.1) — `result -` N for the overload in namespace `std`.

(29.2) — `{last, result -` N`}` for the overloads in namespace `ranges`.

181) `copy_backward` can be used instead of `copy` when `last` is in the range [`result -` N, `result`).

30 *Complexity*: Exactly N assignments.

26.7.2 Move [alg.move]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator move(InputIterator first, InputIterator last,
                                OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_movable<I, O>
  constexpr ranges::move_result<I, O>
    ranges::move(I first, S last, O result);
template<input_range R, weakly_incrementable O>
  requires indirectly_movable<iterator_t<R>, O>
  constexpr ranges::move_result<borrowed_iterator_t<R>, O>
    ranges::move(R&& r, O result);
```

1 Let $E(n)$ be

(1.1) — `std::move(*(first + n))` for the overload in namespace `std`;

(1.2) — `ranges::iter_move(first + n)` for the overloads in namespace `ranges`.

Let N be `last - first`.

2 *Preconditions*: `result` is not in the range [`first`, `last`).

3 *Effects*: Moves elements in the range [`first`, `last`) into the range [`result`, `result + N`) starting from `first` and proceeding to `last`. For each non-negative integer $n < N$, performs `*(result + n) =` $E(n)$.

4 *Returns*:

(4.1) — `result + N` for the overload in namespace `std`.

(4.2) — `{last, result + N}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly N assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2 move(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result);

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O, sized_sentinel_for<O> OutS>
  requires indirectly_movable<I, O>
  ranges::move_result<I, O>
    ranges::move(Ep&& exec, I first, S last, O result, OutS result_last);
template<execution-policy Ep, sized-random-access-range R, sized-random-access-range OutR>
  requires indirectly_movable<iterator_t<R>, iterator_t<OutR>>
  ranges::move_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR>>
    ranges::move(Ep&& exec, R&& r, OutR&& result_r);
```

6 Let $E(n)$ be:

(6.1) — `std::move(*(first + n))` for the overload in namespace `std`;

(6.2) — `ranges::iter_move(first + n)` for the overloads in namespace `ranges`.

7 Let `result_last` be `result + (last - first)` for the overloads in namespace `std`.

8 Let N be min(`last - first`, `result_last - result`).

9 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

10 *Effects*: Moves elements in the range [`first`, `first + N`) into the range [`result`, `result + N`). For each non-negative integer $n < N$, performs `*(result + n) =` $E(n)$.

11 *Returns*:

(11.1) — `result + N` for the overload in namespace `std`.

(11.2) — `{first + N, result + N}` for the overloads in namespace `ranges`.

12 *Complexity*: Exactly N assignments.

```
template<class BidirectionalIterator1, class BidirectionalIterator2>
  constexpr BidirectionalIterator2
    move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
                  BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
  requires indirectly_movable<I1, I2>
  constexpr ranges::move_backward_result<I1, I2>
    ranges::move_backward(I1 first, S1 last, I2 result);
template<bidirectional_range R, bidirectional_iterator I>
  requires indirectly_movable<iterator_t<R>, I>
  constexpr ranges::move_backward_result<borrowed_iterator_t<R>, I>
    ranges::move_backward(R&& r, I result);
```

13 Let $E(n)$ be

(13.1) — `std::move(*(last - n))` for the overload in namespace `std`;

(13.2) — `ranges::iter_move(last - n)` for the overloads in namespace `ranges`.

Let N be `last - first`.

14 *Preconditions*: `result` is not in the range (`first`, `last`].

15 *Effects*: Moves elements in the range [`first`, `last`) into the range [`result - N`, `result`) starting from `last - 1` and proceeding to `first`.[182] For each positive integer $n \leq N$, performs `*(result - n) =` $E(n)$.

16 *Returns*:

(16.1) — `result - N` for the overload in namespace `std`.

(16.2) — `{last, result - N}` for the overloads in namespace `ranges`.

17 *Complexity*: Exactly N assignments.

26.7.3 Swap [alg.swap]

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr ForwardIterator2
    swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    swap_ranges(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
  requires indirectly_swappable<I1, I2>
  constexpr ranges::swap_ranges_result<I1, I2>
    ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
template<input_range R1, input_range R2>
  requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
  constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::swap_ranges(R1&& r1, R2&& r2);

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2>
  requires indirectly_swappable<I1, I2>
  ranges::swap_ranges_result<I1, I2>
    ranges::swap_ranges(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2);
```

182) `move_backward` can be used instead of `move` when `last` is in the range [`result - N`, `result`).

```
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2>
  requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
  ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::swap_ranges(Ep&& exec, R1&& r1, R2&& r2);
```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads in namespace `std` with no parameter named `last2`;

(1.2) — M be min(`last1 - first1`, `last2 - first2`).

2 *Preconditions*: The two ranges [`first1`, `last1`) and [`first2`, `last2`) do not overlap. For the overloads in namespace `std`, `*(first1 + `n`)` is swappable with (16.4.4.3) `*(first2 + `n`)`.

3 *Effects*: For each non-negative integer $n < M$ performs:

(3.1) — `swap(*(first1 + `n`), *(first2 + `n`))` for the overloads in namespace `std`;

(3.2) — `ranges::iter_swap(first1 + `n`, first2 + `n`)` for the overloads in namespace `ranges`.

4 *Returns*:

(4.1) — `last2` for the overloads in namespace `std`.

(4.2) — `{first1 + `M`, first2 + `M`}` for the overloads in namespace `ranges`.

5 *Complexity*: Exactly M swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
  constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6 *Preconditions*: `a` and `b` are dereferenceable. `*a` is swappable with (16.4.4.3) `*b`.

7 *Effects*: As if by `swap(*a, *b)`.

26.7.4 Transform [alg.transform]

```
template<class InputIterator, class OutputIterator,
         class UnaryOperation>
  constexpr OutputIterator
    transform(InputIterator first1, InputIterator last1,
              OutputIterator result, UnaryOperation op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class UnaryOperation>
  ForwardIterator2
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    transform(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, OutputIterator result,
              BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class BinaryOperation>
  ForwardIterator
    transform(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator result,
              BinaryOperation binary_op);

```

1 Let:

(1.1) — `last2` be `first2 + (last1 - first1)` for the overloads in namespace `std` with parameter `first2` but no parameter `last2`;

(1.2) — M be `last1 - first1` for unary transforms, or min(`last1 - first1`, `last2 - first2`) for binary transforms;

(1.3) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(1.4) — N be min(M, `result_last - result`);

(1.5) — E(`i`) be

(1.5.1) — `op(*(first1 + (i - result)))` for unary transforms defined in namespace `std`;

(1.5.2) — `binary_op(*(first1 + (i - result)), *(first2 + (i - result)))` for binary transforms defined in namespace `std`;

(1.5.3) — `invoke(op, invoke(proj, *(first1 + (i - result))))` for unary transforms defined in namespace `ranges`;

(1.5.4) — `invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result))))` for binary transforms defined in namespace `ranges`.

2 *Preconditions*: For parallel algorithm overloads `op` and `binary_op` satisfy the requirements specified in 26.3.2. `op` and `binary_op` do not invalidate iterators or subranges, nor modify elements in the ranges

(2.1) — [`first1`, `first1 +` N],

(2.2) — [`first2`, `first2 +` N], and

(2.3) — [`result`, `result +` N].[183]

3 *Effects*: Assigns through every iterator `i` in the range [`result`, `result +` N) a new corresponding value equal to E(`i`).

4 *Returns*:

(4.1) — `result +` N for the overloads defined in namespace `std`.

(4.2) — `{first1 +` N`, result +` N`}` for unary transforms defined in namespace `ranges`.

(4.3) — `{first1 +` N`, first2 +` N`, result +` N`}` for binary transforms defined in namespace `ranges`.

5 *Complexity*: Exactly N applications of `op` or `binary_op`, and any projections. This requirement also applies to the parallel algorithm overloads.

6 *Remarks*: `result` may be equal to `first1` or `first2`.

26.7.5 Replace [alg.replace]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr void replace(ForwardIterator first, ForwardIterator last,
                         const T& old_value, const T& new_value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  void replace(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate,
         class T = iterator_traits<ForwardIterator>::value_type>

```

6 Let E(i) be

(6.1) — `bool(*(first + (i - result)) == old_value)` for `replace_copy`;

(6.2) — `bool(pred(*(first + (i - result))))` for `replace_copy_if`;

(6.3) — `bool(invoke(proj, *(first + (i - result))) == old_value)` for `ranges::replace_copy`;

(6.4) — `bool(invoke(pred, invoke(proj, *(first + (i - result)))))` for `ranges::replace_copy_if`.

7 Let:

(7.1) — `result_last` be `result + (last - first)` for the overloads with no parameter `result_last` or `result_r`;

(7.2) — N be min(`last - first`, `result_last - result`).

8 *Mandates*: The results of the expressions `*first` and `new_value` are writable (24.3.1) to `result`.

9 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

10 *Effects*: Assigns through every iterator `i` in the range [`result`, `result + N`) a new corresponding value

(10.1) — `new_value` if E(i) is `true` or

(10.2) — `*(first + (i - result))` otherwise.

11 *Returns*:

(11.1) — `result + N` for the overloads in namespace `std`.

(11.2) — {`first + N`, `result + N`} for the overloads in namespace `ranges`.

12 *Complexity*: Exactly N applications of the corresponding predicate and any projection.

26.7.6 Fill [alg.fill]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>
  void fill(ExecutionPolicy&& exec,
            ForwardIterator first, ForwardIterator last, const T& value);
```

```
template<class OutputIterator, class Size, class T = iterator_traits<OutputIterator>::value_type>
  constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size,
         class T = iterator_traits<ForwardIterator>::value_type>
  ForwardIterator fill_n(ExecutionPolicy&& exec,
                         ForwardIterator first, Size n, const T& value);

template<class O, sentinel_for<O> S, class T = iter_value_t<O>>
  requires output_iterator<O, const T&>
  constexpr O ranges::fill(O first, S last, const T& value);
template<class R, class T = range_value_t<R>>
  requires output_range<R, const T&>
  constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class O, class T = iter_value_t<O>>
  requires output_iterator<O, const T&>
  constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);

template<execution-policy Ep, random_access_iterator O, sized_sentinel_for<O> S,
         class T = iter_value_t<O>>
  requires indirectly_writable<O, const T&>
  O ranges::fill(Ep&& exec, O first, S last, const T& value);
template<execution-policy Ep, sized-random-access-range R, class T = range_value_t<R>>
  requires indirectly_writable<iterator_t<R>, const T&>
  borrowed_iterator_t<R> fill(Ep&& exec, R&& r, const T& value);
template<execution-policy Ep, random_access_iterator O, class T = iter_value_t<O>>
  requires indirectly_writable<O, const T&>
  O ranges::fill_n(Ep&& exec, O first, iter_difference_t<O> n, const T& value);
```

1 Let N be $\max(0, \texttt{n})$ for the `fill_n` algorithms, and `last - first` for the `fill` algorithms.

2 *Mandates*: The expression `value` is writable (24.3.1) to the output iterator. The type `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns `value` through all the iterators in the range $[\texttt{first}, \texttt{first} + N)$.

4 *Returns*: `first` + N.

5 *Complexity*: Exactly N assignments.

26.7.7 Generate [alg.generate]

```
template<class ForwardIterator, class Generator>
  constexpr void generate(ForwardIterator first, ForwardIterator last,
                          Generator gen);

template<input_or_output_iterator O, copy_constructible F>
  requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
  constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);
```

1 Let N be $\max(0, \texttt{n})$ for the `generate_n` algorithms, and `last - first` for the `generate` algorithms.

2 *Mandates*: `Size` is convertible to an integral type (7.3.9, 11.4.8).

3 *Effects*: Assigns the result of successive evaluations of `gen()` through each iterator in the range [`first`, `first + N`).

4 *Returns*: `first + N`.

5 *Complexity*: Exactly N evaluations of `gen()` and assignments.

6 *Remarks*: `gen` may modify objects via its arguments for parallel algorithm overloads (26.3.2).

26.7.8 Remove [alg.remove]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                   const T& value);
template<class ExecutionPolicy, class ForwardIterator,
         class T = iterator_traits<ForwardIterator>::value_type>

  borrowed_subrange_t<R>
    ranges::remove_if(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let E(i) be

(1.1) — `bool(*i == value)` for `remove`;

(1.2) — `bool(pred(*i))` for `remove_if`;

(1.3) — `bool(invoke(proj, *i) == value)` for `ranges::remove`;

(1.4) — `bool(invoke(pred, invoke(proj, *i)))` for `ranges::remove_if`.

2 *Preconditions*: For the algorithms in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: Eliminates all the elements referred to by iterator `i` in the range [`first`, `last`) for which E(i) holds.

4 *Returns*: Let j be the end of the resulting range. Returns:

(4.1) — j for the overloads in namespace `std`.

(4.2) — {j, `last`} for the overloads in namespace `ranges`.

5 *Complexity*: Exactly `last - first` applications of the corresponding predicate and any projection.

6 *Remarks*: Stable (16.4.6.8).

7 [*Note 1*: Each element in the range [`ret`, `last`), where `ret` is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — *end note*]

```
template<class InputIterator, class OutputIterator,
         class T = iterator_traits<InputIterator>::value_type>

6 Let `pred` be `equal_to{}` for the overloads in namespace `std` with no parameter `pred`, and let E(`i`) be

(6.1) — `false` if `i` is equal to `first`; otherwise

(6.2) — `bool(pred(*(i - 1), *i))` for the overloads in namespace `std`;

(6.3) — `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace `ranges`.

7 Let:

(7.1) — M be the number of iterators `i` in the range [`first`, `last`) for which E(`i`) is `false`;

(7.2) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(7.3) — N be min(M, `result_last - result`).

8 *Mandates*: `*first` is writable (24.3.1) to `result`.

9 *Preconditions*:

(9.1) — The ranges [`first`, `last`) and [`result`, `result +` N) do not overlap.

(9.2) — For the overloads in namespace `std`:

(9.2.1) — The comparison function is an equivalence relation.

(9.2.2) — For the overloads with no `ExecutionPolicy`, let `T` be the value type of `InputIterator`. If `InputIterator` models `forward_iterator` (24.3.4.11), then there are no additional requirements for `T`. Otherwise, if `OutputIterator` meets the *Cpp17ForwardIterator* requirements and its value type is the same as `T`, then `T` meets the *Cpp17CopyAssignable* (Table 34) requirements. Otherwise, `T` meets both the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* requirements.

[*Note 1*: For the parallel algorithm overloads in namespace `std`, there can be a performance cost if the value type of `ForwardIterator1` does not meet both the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. For the parallel algorithm overloads in namespace `ranges`, there can be a performance cost if `iter_value_t<I>` does not model `copyable`. — *end note*]

10 *Effects*: Copies only the first N elements referred to by the iterator `i` in the range [`first`, `last`) for which E(`i`) is `false` into the range [`result`, `result +` N).

11 *Returns*:

(11.1) — `result +` N for the overloads in namespace `std`.

(11.2) — `{last, result +` N`}` for the overloads in namespace `ranges`, if N is equal to M.

(11.3) — Otherwise, `{j, result_last}` for the overloads in namespace `ranges`, where `j` is the iterator in [`first`, `last`) for which E(`j`) is `false` and there are exactly N iterators `i` in [`first`, `j`) for which E(`i`) is `false`.

12 *Complexity*: At most `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

26.7.10 Reverse [alg.reverse]

```
template<class BidirectionalIterator>
  constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void reverse(ExecutionPolicy&& exec,
               BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
  requires permutable<I>
  constexpr I ranges::reverse(I first, S last);
template<bidirectional_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S>
  requires permutable<I>
  I ranges::reverse(Ep&& exec, I first, S last);
```

```
template<execution-policy Ep, sized-random-access-range R>
  requires permutable<iterator_t<R>>
  borrowed_iterator_t<R> ranges::reverse(Ep&& exec, R&& r);
```

1 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

2 *Effects*: For each non-negative integer `i < (last - first) / 2`, applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i, (last - i) - 1`.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first)/2` swaps.

```
template<class BidirectionalIterator, class OutputIterator>
  constexpr OutputIterator
    reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                 OutputIterator result);
template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
  ForwardIterator
    reverse_copy(ExecutionPolicy&& exec,
                 BidirectionalIterator first, BidirectionalIterator last,
                 ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
  requires indirectly_copyable<I, O>
  constexpr ranges::reverse_copy_result<I, O>
    ranges::reverse_copy(I first, S last, O result);
template<bidirectional_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
    ranges::reverse_copy(R&& r, O result);
```

5 Let N be `last - first`.

6 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

7 *Effects*: Copies the range [`first`, `last`) to the range [`result`, `result + N`) such that for every non-negative integer `i < N` the following assignment takes place: `*(result + N - 1 - i) = *(first + i)`.

8 *Returns*:

(8.1) — `result + N` for the overloads in namespace `std`.

(8.2) — `{last, result + N}` for the overloads in namespace `ranges`.

9 *Complexity*: Exactly N assignments.

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O, sized_sentinel_for<O> OutS>
  requires indirectly_copyable<I, O>
  ranges::reverse_copy_truncated_result<I, O>
    ranges::reverse_copy(Ep&& exec, I first, S last, O result,
                         OutS result_last);
template<execution-policy Ep, sized-random-access-range R, sized-random-access-range OutR>
  requires indirectly_copyable<iterator_t<R>, iterator_t<OutR>>
  ranges::reverse_copy_truncated_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR>>
    ranges::reverse_copy(Ep&& exec, R&& r, OutR&& result_r);
```

10 Let N be min(`last - first`, `result_last - result`), and let *NEW_FIRST* be `first + (last - first) - N`.

11 *Preconditions*: The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

12 *Effects*: Copies the range [*NEW_FIRST*, `last`) to the range [`result`, `result + N`) such that for every non-negative integer $i < N$ the following assignment takes place: `*(result + N - 1 - i) = *(NEW_FIRST + i)`.

13 *Returns*: `{last, NEW_FIRST, result + N}`.

14 *Complexity*: Exactly N assignments.

26.7.11 Rotate [alg.rotate]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    rotate(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::rotate(I first, I middle, S last);
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S>
  requires permutable<I>
  subrange<I> ranges::rotate(Ep&& exec, I first, I middle, S last);
```

1 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

2 *Effects*: For each non-negative integer `i < (last - first)`, places the element from the position `first + i` into position `first + (i + (last - middle)) % (last - first)`.

[*Note 1*: This is a left rotate. — *end note*]

3 *Returns*:

(3.1) — `first + (last - middle)` for the overloads in namespace `std`.

(3.2) — `{first + (last - middle), last}` for the overload in namespace `ranges`.

4 *Complexity*: At most `last - first` swaps.

```
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);
```

5 *Effects*: Equivalent to: `return ranges::rotate(ranges::begin(r), middle, ranges::end(r));`

```
template<execution-policy Ep, sized-random-access-range R>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R> ranges::rotate(Ep&& exec, R&& r, iterator_t<R> middle);
```

6 *Effects*: Equivalent to:

```
return ranges::rotate(std::forward<Ep>(exec), ranges::begin(r), middle,
                      ranges::begin(r) + ranges::distance(r));
```

```
template<class ForwardIterator, class OutputIterator>
  constexpr OutputIterator
    rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
                OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    rotate_copy(ExecutionPolicy&& exec,
                ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
                ForwardIterator2 result);

  template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
    requires indirectly_copyable<I, O>
    constexpr ranges::rotate_copy_result<I, O>
      ranges::rotate_copy(I first, I middle, S last, O result);
```

7 Let N be `last - first`.

8 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

9 *Effects*: Copies the range [`first`, `last`) to the range [`result`, `result + N`) such that for each non-negative integer $i < N$ the following assignment takes place: `*(result + i) = *(first + (i + (middle - first)) % N)`.

10 *Returns*:

(10.1) — `result + N` for the overloads in namespace `std`.

(10.2) — `{last, result + N}` for the overload in namespace `ranges`.

11 *Complexity*: Exactly N assignments.

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O, sized_sentinel_for<O> OutS>
  requires indirectly_copyable<I, O>
  ranges::rotate_copy_truncated_result<I, O>
    ranges::rotate_copy(Ep&& exec, I first, I middle, S last, O result, OutS result_last);
```

12 Let M be `last - first` and N be min(M, `result_last - result`).

13 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. The ranges [`first`, `last`) and [`result`, `result + N`) do not overlap.

14 *Effects*: Copies the range [`first`, `last`) to the range [`result`, `result + N`) such that for each non-negative integer $i < N$ the following assignment takes place: `*(result + i) = *(first + (i + (middle - first)) % M)`.

15 *Returns*:

(15.1) — `{middle + N, first, result + N}` if N is less than `last - middle`.

(15.2) — Otherwise, `{last, first + (N + (middle - first)) % M, result + N}`.

16 *Complexity*: Exactly N assignments.

```
template<forward_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
    ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);
```

17 *Effects*: Equivalent to:

```
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));
```

```
template<execution-policy Ep, sized-random-access-range R, sized-random-access-range OutR>
  requires indirectly_copyable<iterator_t<R>, iterator_t<OutR>>
  ranges::rotate_copy_truncated_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR>>
    ranges::rotate_copy(Ep&& exec, R&& r, iterator_t<R> middle, OutR&& result_r);
```

18 *Effects*: Equivalent to:

```
return ranges::rotate_copy(std::forward<Ep>(exec), ranges::begin(r), middle,
                           ranges::begin(r) + ranges::distance(r),
                           ranges::begin(result_r),
                           ranges::begin(result_r) + ranges::distance(result_r));
```

26.7.12 Sample [alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,
         class Distance, class UniformRandomBitGenerator>
  SampleIterator sample(PopulationIterator first, PopulationIterator last,
                        SampleIterator out, Distance n,
                        UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
  requires (forward_iterator<I> || random_access_iterator<O>) &&
           indirectly_copyable<I, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
```

```
template<input_range R, weakly_incrementable O, class Gen>
  requires (forward_range<R> || random_access_iterator<O>) &&
           indirectly_copyable<iterator_t<R>, O> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

1 *Mandates*: For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (24.3.1) to `out`.

2 *Preconditions*: `out` is not in the range [`first`, `last`). For the overload in namespace `std`:

(2.1) — `PopulationIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

(2.2) — `SampleIterator` meets the *Cpp17OutputIterator* requirements (24.3.5.4).

(2.3) — `SampleIterator` meets the *Cpp17RandomAccessIterator* requirements (24.3.5.7) unless `PopulationIterator` models `forward_iterator` (24.3.4.11).

(2.4) — `remove_reference_t<UniformRandomBitGenerator>` meets the requirements of a uniform random bit generator type (29.5.3.3).

3 *Effects*: Copies min(`last - first`, `n`) elements (the *sample*) from [`first`, `last`) (the *population*) to `out` such that each possible sample has equal probability of appearance.

[*Note 1*: Algorithms that obtain such effects include *selection sampling* and *reservoir sampling*. — *end note*]

4 *Returns*: The end of the resulting sample range.

5 *Complexity*: $\mathcal{O}$(`last - first`).

6 *Remarks*:

(6.1) — For the overload in namespace `std`, stable if and only if `PopulationIterator` models `forward_iterator`. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.

(6.2) — To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation's source of randomness.

26.7.13 Shuffle [alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>
  void shuffle(RandomAccessIterator first,
               RandomAccessIterator last,
               UniformRandomBitGenerator&& g);

template<random_access_iterator I, sentinel_for<I> S, class Gen>
  requires permutable<I> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  I ranges::shuffle(I first, S last, Gen&& g);
template<random_access_range R, class Gen>
  requires permutable<iterator_t<R>> &&
           uniform_random_bit_generator<remove_reference_t<Gen>>
  borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions*: For the overload in namespace `std`:

(1.1) — `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

(1.2) — The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (29.5.3.3) requirements.

2 *Effects*: Permutes the elements in the range [`first`, `last`) such that each possible permutation of those elements has equal probability of appearance.

3 *Returns*: `last` for the overloads in namespace `ranges`.

4 *Complexity*: Exactly `(last - first) - 1` swaps.

5 *Remarks*: To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation's source of randomness.

26.7.14 Shift [alg.shift]

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
               typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n);

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S>
  requires permutable<I>
  subrange<I>
    ranges::shift_left(Ep&& exec, I first, S last, iter_difference_t<I> n);
template<execution-policy Ep, sized-random-access-range R>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R>
    ranges::shift_left(Ep&& exec, R&& r, range_difference_t<R> n);
```

1 *Preconditions*: `n >= 0` is `true`. For the overloads in namespace `std`, the type of `*first` meets the *Cpp17MoveAssignable* requirements.

2 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. For the non-parallel algorithm overloads, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

3 *Returns*: Let *NEW_LAST* be `first + (last - first - n)` if `n < last - first`, otherwise `first`. Returns:

(3.1) — *NEW_LAST* for the overloads in namespace `std`.

(3.2) — `{first, `*NEW_LAST*`}` for the overloads in namespace `ranges`.

4 *Complexity*: At most `(last - first) - n` assignments.

```
template<class ForwardIterator>
  constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
  constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
template<forward_range R>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S>
  requires permutable<I>
  subrange<I>
    ranges::shift_right(Ep&& exec, I first, S last, iter_difference_t<I> n);
template<execution-policy Ep, sized-random-access-range R>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R>
    ranges::shift_right(Ep&& exec, R&& r, range_difference_t<R> n);
```

5 *Preconditions*: `n >= 0` is `true`. For the overloads in namespace `std`, the type of `*first` meets

the *Cpp17MoveAssignable* requirements, and `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements (24.3.5.6) or the *Cpp17ValueSwappable* requirements.

6 *Effects*: If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer `i < (last - first) - n`. Does so in order starting from `i = (last - first) - n - 1` and proceeding to `i = 0` if

(6.1) — for the non-parallel algorithm overload in namespace `std`, `ForwardIterator` meets the *Cpp17BidirectionalIterator* requirements,

(6.2) — for the non-parallel algorithm overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

7 *Returns*: Let *`NEW_FIRST`* be `first + n` if `n < last - first`, otherwise `last`. Returns:

(7.1) — *`NEW_FIRST`* for the overloads in namespace `std`.

(7.2) — `{`*`NEW_FIRST`*`, last}` for the overloads in namespace `ranges`.

8 *Complexity*: At most `(last - first) - n` assignments or swaps.

26.8 Sorting and related operations [alg.sorting]

26.8.1 General [alg.sorting.general]

1 The operations in 26.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

2 `Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (26.2). The return value of the function call operation applied to an object of type `Compare`, when converted to `bool`, yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.

3 For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j) != false` defaults to `*i < *j != false`. For algorithms other than those described in 26.8.4, `comp` shall induce a strict weak ordering on the values.

4 The term *strict* refers to the requirement of an irreflexive relation (`!comp(x, x)` for all `x`), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

(4.1) — `comp(a, b) && comp(b, c)` implies `comp(a, c)`

(4.2) — `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[*Note 1*: Under these conditions, it can be shown that

(4.3) — `equiv` is an equivalence relation,

(4.4) — `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and

(4.5) — the induced relation is a strict total ordering.

— *end note*]

5 A sequence is *sorted with respect to a `comp` and `proj`* for a comparator and projection `comp` and `proj` if for every iterator `i` pointing to the sequence and every non-negative integer `n` such that `i + n` is a valid iterator pointing to an element of the sequence,

```
bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))
```

is `false`.

6 A sequence is *sorted with respect to a comparator `comp`* for a comparator `comp` if it is sorted with respect to `comp` and `identity{}` (the identity projection).

7 A sequence [`start`, `finish`) is *partitioned with respect to an expression* `f(e)` if there exists an integer `n` such that for all `0 <= i < (finish - start)`, `f(*(start + i))` is `true` if and only if `i < n`.

8 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an `operator==`, but an equivalence relation induced by the strict weak ordering. That is, two elements `a` and `b` are considered equivalent if and only if `!(a < b) && !(b < a)`.

26.8.2 Sorting [alg.sort]

26.8.2.1 `sort` [sort]

```
template<class RandomAccessIterator>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                      Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void sort(ExecutionPolicy&& exec,
            RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::sort(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R> ranges::sort(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts the elements in the range [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

26.8.2.2 `stable_sort` [stable.sort]

```
template<class RandomAccessIterator>
  constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void stable_sort(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator last,
                   Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::stable_sort(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::stable_sort(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts the elements in the range [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: Let N be `last - first`. If enough extra memory is available, $N \log(N)$ comparisons. Otherwise, at most $N \log^2(N)$ comparisons. In either case, twice as many projections as the number of comparisons.

6 *Remarks*: Stable (16.4.6.8).

26.8.2.3 `partial_sort` [partial.sort]

```
template<class RandomAccessIterator>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void partial_sort(RandomAccessIterator first,
                              RandomAccessIterator middle,
                              RandomAccessIterator last,
                              Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void partial_sort(ExecutionPolicy&& exec,
                    RandomAccessIterator first,
                    RandomAccessIterator middle,
                    RandomAccessIterator last,
                    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::partial_sort(Ep&& exec, I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Places the first `middle - first` elements from the range [`first`, `last`) as sorted with respect to `comp` and `proj` into the range [`first`, `middle`). The rest of the elements in the range [`middle`, `last`) are placed in an unspecified order.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: Approximately `(last - first) * log(middle - first)` comparisons, and twice as many projections.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

```
template<execution-policy Ep, sized-random-access-range R,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::partial_sort(Ep&& exec, R&& r, iterator_t<R> middle, Comp comp = {},
                         Proj proj = {});
```

7 *Effects*: Equivalent to:

```
return ranges::partial_sort(std::forward<Ep>(exec), ranges::begin(r), middle,
                            ranges::begin(r) + ranges::distance(r),
                            comp, proj);
```

26.8.2.4 `partial_sort_copy` [partial.sort.copy]

```
template<class InputIterator, class RandomAccessIterator>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
         class Compare>
  constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);
```

```
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
         class Compare>
  RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last,
                      RandomAccessIterator result_first,
                      RandomAccessIterator result_last,
                      Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
  constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
                              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, random_access_range R2, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
           sortable<iterator_t<R2>, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                                      projected<iterator_t<R2>, Proj2>>
  constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
                              Proj1 proj1 = {}, Proj2 proj2 = {});

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
  ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(Ep&& exec, I1 first, S1 last, I2 result_first, S2 result_last,
                              Comp comp = {}, Proj1 proj1 = {},
                              Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
           sortable<iterator_t<R2>, Comp, Proj2> &&
           indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
                                      projected<iterator_t<R2>, Proj2>>
  ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(Ep&& exec, R1&& r, R2&& result_r, Comp comp = {},
                              Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let N be min(`last - first`, `result_last - result_first`). Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (24.3.1) to `result_first`.

3 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), the type of `*result_first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

4 For iterators `a1` and `b1` in [`first`, `last`), and iterators `x2` and `y2` in [`result_first`, `result_last`), after evaluating the assignment `*y2 = *b1`, let E be the value of

```
bool(invoke(comp, invoke(proj1, *a1), invoke(proj2, *y2))).
```

Then, after evaluating the assignment `*x2 = *a1`, E is equal to

```
bool(invoke(comp, invoke(proj2, *x2), invoke(proj2, *y2))).
```

[*Note 1*: Writing a value from the input range into the output range does not affect how it is ordered by `comp` and `proj1` or `proj2`. — *end note*]

5 *Effects*: Places the first N elements as sorted with respect to `comp` and `proj2` into the range [`result_first`, `result_first + N`).

6 *Returns*:

(6.1) — `result_first + N` for the overloads in namespace `std`.

(6.2) — `{last, result_first + N}` for the overloads in namespace `ranges`.

7 *Complexity*: Approximately `(last - first) * log N` comparisons, and twice as many projections.

26.8.2.5 `is_sorted` [is.sorted]

```
template<class ForwardIterator>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

1 *Effects*: Equivalent to: `return is_sorted_until(first, last) == last;`

```
template<class ExecutionPolicy, class ForwardIterator>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class ForwardIterator, class Compare>
  constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                           Compare comp);
```

3 *Effects*: Equivalent to: `return is_sorted_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  bool is_sorted(ExecutionPolicy&& exec,
                 ForwardIterator first, ForwardIterator last,
                 Compare comp);
```

4 *Effects*: Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_sorted(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_sorted_until(first, last, comp, proj) == last;`

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  bool ranges::is_sorted(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  bool ranges::is_sorted(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::is_sorted_until(std::forward<Ep>(exec), first, last, comp, proj) == last;
```

```
template<class ForwardIterator>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
  constexpr ForwardIterator
    is_sorted_until(ForwardIterator first, ForwardIterator last,
                    Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator
    is_sorted_until(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last,
                    Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  I ranges::is_sorted_until(Ep&& exec, I first, S last, Comp comp = {},
                            Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  borrowed_iterator_t<R>
    ranges::is_sorted_until(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Returns*: The last iterator `i` in $[$`first`, `last`$]$ for which the range $[$`first`, `i`$)$ is sorted with respect to `comp` and `proj`.

9 *Complexity*: Linear.

26.8.3 Nth element [alg.nth.element]

```
template<class RandomAccessIterator>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth,
                             RandomAccessIterator last,  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void nth_element(ExecutionPolicy&& exec,
                   RandomAccessIterator first, RandomAccessIterator nth,
                   RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::nth_element(Ep&& exec, I first, I nth, S last, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: $[$`first`, `nth`$)$ and $[$`nth`, `last`$)$ are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3), and the type of

`*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range [`first`, `nth`) and every iterator `j` in the range [`nth`, `last`) it holds that: `bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))` is `false`.

4 *Returns*: `last` for the overload in namespace `ranges`.

5 *Complexity*: For the non-parallel algorithm overloads, linear on average. For the parallel algorithm overloads, $\mathcal{O}(N)$ applications of the predicate, and $\mathcal{O}(N \log N)$ swaps, where $N =$ `last - first`.

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

```
template<execution-policy Ep, sized-random-access-range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::nth_element(Ep&& exec, R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
```

7 *Effects*: Equivalent to:

```
return ranges::nth_element(std::forward<Ep>(exec), ranges::begin(r), nth,
                           ranges::begin(r) + ranges::distance(r),
                           comp, proj);
```

26.8.4 Binary search [alg.binary.search]

26.8.4.1 General [alg.binary.search.general]

1 All of the algorithms in 26.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

26.8.4.2 `lower_bound` [lower.bound]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr ForwardIterator
    lower_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {},
                                  Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expression `bool(invoke(comp, invoke(proj, e), value))`.

3 *Returns*: The furthermost iterator `i` in the range [`first`, `last`] such that for every iterator `j` in the range [`first`, `i`), `bool(invoke(comp, invoke(proj, *j), value))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.4.3 `upper_bound` [upper.bound]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr ForwardIterator
    upper_bound(ForwardIterator first, ForwardIterator last,
                const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expression `!bool(invoke(comp, value, invoke(proj, e)))`.

3 *Returns*: The furthermost iterator `i` in the range [`first`, `last`] such that for every iterator `j` in the range [`first`, `i`), `!bool(invoke(comp, value, invoke(proj, *j)))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.4.4 `equal_range` [equal.range]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    equal_range(ForwardIterator first,
                ForwardIterator last, const T& value,
                Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr subrange<I>
    ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr borrowed_subrange_t<R>
    ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of [`first`, `last`), `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*:

(3.1) — For the overloads in namespace `std`:

```
{lower_bound(first, last, value, comp),
 upper_bound(first, last, value, comp)}
```

(3.2) — For the overloads in namespace `ranges`:

```
{ranges::lower_bound(first, last, value, comp, proj),
 ranges::upper_bound(first, last, value, comp, proj)}
```

4 *Complexity*: At most $2 * \log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.4.5 `binary_search` [binary.search]

```
template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value);

template<class ForwardIterator, class T = iterator_traits<ForwardIterator>::value_type,
         class Compare>
  constexpr bool
    binary_search(ForwardIterator first, ForwardIterator last,
                  const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         class T = projected_value_t<I, Proj>,
         indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                       Proj proj = {});
template<forward_range R, class Proj = identity,
         class T = projected_value_t<iterator_t<R>, Proj>,
         indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp =
           ranges::less>
  constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},
                                       Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to the expressions `bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of [`first`, `last`), `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 *Returns*: `true` if and only if for some iterator `i` in the range [`first`, `last`), `!bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i)))` is `true`.

4 *Complexity*: At most $\log_2(\texttt{last - first}) + \mathcal{O}(1)$ comparisons and projections.

26.8.5 Partitions [alg.partitions]

```
template<class InputIterator, class Predicate>
  constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  bool is_partitioned(ExecutionPolicy&& exec,
                      ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  bool ranges::is_partitioned(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  bool ranges::is_partitioned(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

1 Let `proj` be `identity{}` for the overloads with no parameter named `proj`.

2 *Returns*: `true` if and only if the elements `e` of [`first`,`last`) are partitioned with respect to the expression `bool(invoke(pred, invoke(proj, e)))`.

3 *Complexity*: Linear. At most `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition(ForwardIterator first, ForwardIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
  ForwardIterator
    partition(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr subrange<I>
    ranges::partition(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R>
    ranges::partition(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  subrange<I> ranges::partition(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R> ranges::partition(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

4 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

5 *Preconditions*: For the overloads in namespace `std`, `ForwardIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

6 *Effects*: Places all the elements `e` in [`first`,`last`) that satisfy E(`e`) before all the elements that do not.

7 *Returns*: Let `i` be an iterator such that E(`*j`) is `true` for every iterator `j` in [`first`,`i`) and `false` for every iterator `j` in [`i`,`last`). Returns:

(7.1) — `i` for the overloads in namespace `std`.

(7.2) — `{i, last}` for the overloads in namespace `ranges`.

8 *Complexity*: Let $N =$ `last - first`:

(8.1) — For the non-parallel algorithm overloads, exactly N applications of the predicate and projection. At most $N/2$ swaps if the type of `first` meets the *Cpp17BidirectionalIterator* requirements for the overloads in namespace `std` or models `bidirectional_iterator` for the overloads in namespace `ranges`, and at most N swaps otherwise.

(8.2) — For the parallel algorithm overloads, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    constexpr stable_partition(BidirectionalIterator first, BidirectionalIterator last,
                               Predicate pred);
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
  BidirectionalIterator
    stable_partition(ExecutionPolicy&& exec,
                     BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  constexpr subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});
template<bidirectional_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  constexpr borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  subrange<I>
    ranges::stable_partition(Ep&& exec, I first, S last, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R>
    ranges::stable_partition(Ep&& exec, R&& r, Pred pred, Proj proj = {});
```

9 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

10 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

11 *Effects*: Places all the elements `e` in [`first`, `last`) that satisfy E(`e`) before all the elements that do not. The relative order of the elements in both groups is preserved.

12 *Returns*: Let `i` be an iterator such that for every iterator `j` in [`first`, `i`), E(`*j`) is `true`, and for every iterator `j` in the range [`i`, `last`), E(`*j`) is `false`. Returns:

(12.1) — `i` for the overloads in namespace `std`.

(12.2) — `{i, last}` for the overloads in namespace `ranges`.

13 *Complexity*: Let $N =$ `last - first`:

(13.1) — For the non-parallel algorithm overloads, at most $N \log_2 N$ swaps, but only $\mathcal{O}(N)$ swaps if there is enough extra memory. Exactly N applications of the predicate and projection.

(13.2) — For the parallel algorithm overloads, $\mathcal{O}(N \log N)$ swaps and $\mathcal{O}(N)$ applications of the predicate.

```
template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
  constexpr pair<OutputIterator1, OutputIterator2>
    partition_copy(InputIterator first, InputIterator last,
                   OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1,
         class ForwardIterator2, class Predicate>
  pair<ForwardIterator1, ForwardIterator2>
    partition_copy(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
  constexpr ranges::partition_copy_result<I, O1, O2>
    ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
                           Proj proj = {});
template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, O1> &&
           indirectly_copyable<iterator_t<R>, O2>
  constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
    ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         random_access_iterator O1, sized_sentinel_for<O1> OutS1,
         random_access_iterator O2, sized_sentinel_for<O2> OutS2,
         class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
  requires indirectly_copyable<I, O1> && indirectly_copyable<I, O2>
  ranges::partition_copy_result<I, O1, O2>
    ranges::partition_copy(Ep&& exec, I first, S last, O1 out_true, OutS1 last_true,
                           O2 out_false, OutS2 last_false, Pred pred, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R,
         sized-random-access-range OutR1, sized-random-access-range OutR2,
         class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires indirectly_copyable<iterator_t<R>, iterator_t<OutR1>> &&
           indirectly_copyable<iterator_t<R>, iterator_t<OutR2>>
  ranges::partition_copy_result<borrowed_iterator_t<R>, borrowed_iterator_t<OutR1>,
                                borrowed_iterator_t<OutR2>>
    ranges::partition_copy(Ep&& exec, R&& r, OutR1&& out_true_r, OutR2&& out_false_r,
                           Pred pred, Proj proj = {});
```

14 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

15 For the overloads with no parameters `last_true`, `last_false`, `out_true_r`, or `out_false_r`, let

(15.1) — M be the number of iterators `i` in [`first`, `last`) for which E(`*i`) is `true`, and K be `last - first -` M;

(15.2) — `last_true` be `out_true +` M, and `last_false` be `out_false +` K.

16 For the overloads with parameters `last_true`, `last_false`, `out_true_r`, or `out_false_r`, let M be `last_true - out_true` and K be `last_false - out_false`.

17 Let:

(17.1) — `i1` be the iterator in [`first`, `last`) for which E(`*i1`) is `true` and there are exactly M iterators `j` in [`first`, `i1`) for which E(`*j`) is `true`, or `last` if no such iterator exists;

(17.2) — `i2` be the iterator in [`first`, `last`) for which E(`*i2`) is `false` and there are exactly K iterators `j` in [`first`, `i2`) for which E(`*j`) is `false`, or `last` if no such iterator exists;

(17.3) — N be min(`i1 - first`, `i2 - first`).

18 *Mandates*: For the overloads in namespace `std`, the expression `*first` is writable (24.3.1) to `out_true` and `out_false`.

19 *Preconditions*: The input range and output ranges do not overlap.

[*Note 1*: For the parallel algorithm overload in namespace `std`, there can be a performance cost if `first`'s value type does not meet the *Cpp17CopyConstructible* requirements. For the parallel algorithm overloads in

namespace `ranges`, there can be a performance cost if `first`'s value type does not model `copy_constructible`. — *end note*]

20 *Effects*: For each iterator `i` in [`first`, `first + N`), copies `*i` to the output range [`out_true`, `last_true`) if E(`*i`) is `true`, or to the output range [`out_false`, `last_false`) otherwise.

21 *Returns*: Let Q be the number of elements copied into the output range [`out_true`, `last_true`), and V be the number of elements copied into the output range [`out_false`, `last_false`). Returns:

(21.1) — `{out_true + Q, out_false + V}` for the overloads in namespace `std`.

(21.2) — `{first + N, out_true + Q, out_false + V}` for the overloads in namespace `ranges`.

22 *Complexity*: At most `last - first` applications of `pred` and `proj`.

```
template<class ForwardIterator, class Predicate>
  constexpr ForwardIterator
    partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
  constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr borrowed_iterator_t<R>
    ranges::partition_point(R&& r, Pred pred, Proj proj = {});
```

23 Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let $E(x)$ be `bool(invoke(pred, invoke(proj, `x`)))`.

24 *Preconditions*: The elements `e` of [`first`, `last`) are partitioned with respect to E(`e`).

25 *Returns*: An iterator `mid` such that E(`*i`) is `true` for all iterators `i` in [`first`, `mid`), and `false` for all iterators `i` in [`mid`, `last`).

26 *Complexity*: $\mathcal{O}$(log(`last - first`)) applications of `pred` and `proj`.

26.8.6 Merge [alg.merge]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    merge(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    merge(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>

    ranges::merge(Ep&& exec, R1&& r1, R2&& r2, OutR&& result_r,
                  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — N be:

(1.1.1) — `(last1 - first1) + (last2 - first2)` for the overloads with no parameter `result_last` or `result_r`;

(1.1.2) — min(`(last1 - first1) + (last2 - first2)`, `result_last - result`) for the overloads with parameters `result_last` or `result_r`;

(1.2) — `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names;

(1.3) — E be `bool(invoke(comp, invoke(proj2, e2), invoke(proj1, e1)))`;

(1.4) — K be the smallest integer in [`0`, `last1 - first1`) such that for the element `e1` in the position `first1 + `K there are at least $N - K$ elements `e2` in [`first2`, `last2`) for which E holds, and be equal to `last1 - first1` if no such integer exists.

[*Note 1*: `first1 + `K points to the position past the last element to be copied. — *end note*]

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Copies the first K elements of the range [`first1`, `last1`) and the first $N - K$ elements of the range [`first2`, `last2`) into the range [`result`, `result + `N). If an element `a` precedes `b` in an input range, `a` is copied into the output range before `b`. If `e1` is an element of [`first1`, `last1`) and `e2` of [`first2`, `last2`), `e2` is copied into the output range before `e1` if and only if E is `true`.

4 *Returns*:

(4.1) — `result + `N for the overloads in namespace `std`.

(4.2) — `{first1 + `K`, first2 + `N` - `K`, result + `N`}` for the overloads in namespace `ranges`.

5 *Complexity*:

(5.1) — For the non-parallel algorithm overloads, at most $N - 1$ comparisons and applications of each projection.

(5.2) — For the parallel algorithm overloads, $\mathcal{O}(N)$ comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8).

```
template<class BidirectionalIterator>
  constexpr void inplace_merge(BidirectionalIterator first,
                               BidirectionalIterator middle,
                               BidirectionalIterator last);
template<class ExecutionPolicy, class BidirectionalIterator>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr void inplace_merge(BidirectionalIterator first,
                               BidirectionalIterator middle,
                               BidirectionalIterator last, Compare comp);
template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
  void inplace_merge(ExecutionPolicy&& exec,
                     BidirectionalIterator first,
                     BidirectionalIterator middle,
                     BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  I ranges::inplace_merge(Ep&& exec, I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Preconditions*: [`first`, `middle`) and [`middle`, `last`) are valid ranges sorted with respect to `comp` and `proj`. For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

9 *Effects*: Merges two sorted consecutive ranges [`first`, `middle`) and [`middle`, `last`), putting the result of the merge into the range [`first`, `last`). The resulting range is sorted with respect to `comp` and `proj`.

10 *Returns*: `last` for the overload in namespace `ranges`.

11 *Complexity*: Let $N =$ `last - first`:

(11.1) — For the non-parallel algorithm overloads, and if enough additional memory is available, at most $N - 1$ comparisons.

(11.2) — Otherwise, $\mathcal{O}(N \log N)$ comparisons.

In either case, twice as many projections as comparisons.

12 *Remarks*: Stable (16.4.6.8).

```
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

13 *Effects*: Equivalent to:

```
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

```
template<execution-policy Ep, sized-random-access-range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  borrowed_iterator_t<R>
    ranges::inplace_merge(Ep&& exec, R&& r, iterator_t<R> middle, Comp comp = {},
```

```
                    Proj proj = {});
```

14 *Effects*: Equivalent to:

```
return ranges::inplace_merge(std::forward<Ep>(exec), ranges::begin(r), middle,
                             ranges::begin(r) + ranges::distance(r),
                             comp, proj);
```

26.8.7 Set operations on sorted structures [alg.set.operations]

26.8.7.1 General [alg.set.operations.general]

1 Subclause 26.8.7 defines all the basic set operations on sorted structures. They also work with `multiset`s (23.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to `multiset`s in a standard way by defining `set_union` to contain the maximum number of occurrences of every element, `set_intersection` to contain the minimum, and so on.

26.8.7.2 `includes` [includes]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
                          InputIterator2 first2, InputIterator2 last2,
                          Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
  bool includes(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
                                  Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
                                  Proj1 proj1 = {}, Proj2 proj2 = {});

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>, projected<I2, Proj2>> Comp =
           ranges::less>
  bool ranges::includes(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  bool ranges::includes(Ep&& exec, R1&& r1, R2&& r2,
                        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let `comp` be `less{}`, `proj1` be `identity{}`, and `proj2` be `identity{}`, for the overloads with no parameters by those names.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively.

3 *Returns*: `true` if and only if [`first2`, `last2`) is a subsequence of [`first1`, `last1`).

[*Note 1*: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some, all, or none of T's elements and keeping the remaining elements in the same order. — *end note*]

4 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

26.8.7.3 `set_union` [set.union]

```
template<class InputIterator1, class InputIterator2, class OutputIterator>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
  constexpr OutputIterator
    set_union(InputIterator1 first1, InputIterator1 last1,
              InputIterator2 first2, InputIterator2 last2,
              OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_union(ExecutionPolicy&& exec,
              ForwardIterator1 first1, ForwardIterator1 last1,
              ForwardIterator2 first2, ForwardIterator2 last2,
              ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         weakly_incrementable O, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<I1, I2, O>
    ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, weakly_incrementable O,
         class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
  constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
    ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         random_access_iterator O, sized_sentinel_for<O> OutS, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
  ranges::set_union_result<I1, I2, O>
    ranges::set_union(Ep&& exec, I1 first1, S1 last1,
                      I2 first2, S2 last2, O result, OutS result_last,
                      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         sized-random-access-range OutR, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, iterator_t<OutR>, Comp, Proj1, Proj2>
  ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>,
                           borrowed_iterator_t<OutR>>
    ranges::set_union(Ep&& exec, R1&& r1, R2&& r2, OutR&& result_r, Comp comp = {},
                      Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names;

(1.2) — M be the number of elements in the sorted union (see below);

(1.3) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(1.4) — N be $\min(M,$ `result_last - result`$)$.

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges. If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, then all m elements from the first range are included in the union, in order, and then the final $\max(n - m, 0)$ elements from the second range are included in the union, in order. If, of those elements, k elements from the first range are copied to the output range, then the first $\min(k, n)$ elements from the second range are considered *skipped*. Copies the first N elements of the sorted union to the range [`result`, `result +` N).

4 *Returns*:

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result +` N`}` for the overloads in namespace `ranges`, if N is equal to M.

(4.3) — Otherwise, `{first1 +` A`, first2 +` B`, result_last}` for the overloads in namespace `ranges`, where A and B are the numbers of copied or skipped elements in [`first1`, `last1`) and [`first2`, `last2`), respectively.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8).

26.8.7.4 `set_intersection` [set.intersection]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
  constexpr OutputIterator
    set_intersection(InputIterator1 first1, InputIterator1 last1,
                     InputIterator2 first2, InputIterator2 last2,
                     OutputIterator result, Compare comp);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
  ForwardIterator
    set_intersection(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2, ForwardIterator2 last2,
                     ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,

  ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>,
                                  borrowed_iterator_t<OutR>>
    ranges::set_intersection(Ep&& exec, R1&& r1, R2&& r2, OutR&& result_r, Comp comp = {},
                             Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names;

(1.2) — M be the number of elements in the sorted intersection (see below);

(1.3) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(1.4) — N be min(M, `result_last - result`).

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges. If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, the first min(m, n) elements from the first range are included in the sorted intersection. If, of those elements, k elements from the first range are copied to the output range, then the first k elements from the second range are considered *skipped*. A non-copied element is also considered skipped if it compares less than the $\min(M, N+1)^{\text{th}}$ element of the sorted intersection. Copies the first N elements of the sorted intersection to the range [`result`, `result +` N).

4 *Returns*:

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, last2, result +` N`}` for the non-parallel algorithm overloads in namespace `ranges`.

(4.3) — Otherwise, `{first1 + A, first2 + B, result + N}` for the parallel algorithm overloads in namespace `ranges`, where A and B are the numbers of copied or skipped elements in [`first1`, `last1`) and [`first2`, `last2`), respectively.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8).

26.8.7.5 `set_difference` [set.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_difference(InputIterator1 first1, InputIterator1 last1,
                   InputIterator2 first2, InputIterator2 last2,
                   OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_difference(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,

```

©ISO/IEC

```
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         sized-random-access-range OutR, class Comp = ranges::less,
         class Proj1 = identity, class Proj2 = identity>
  requires mergeable<iterator_t<R1>, iterator_t<R2>, iterator_t<OutR>, Comp, Proj1, Proj2>
  ranges::set_difference_truncated_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>,
                                          borrowed_iterator_t<OutR>>
    ranges::set_difference(Ep&& exec, R1&& r1, R2&& r2, OutR&& result_r, Comp comp = {},
                           Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names;

(1.2) — M be the number of elements in the sorted difference (see below);

(1.3) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(1.4) — N be min(M, `result_last - result`).

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted difference between the elements from the two ranges; that is, the set of elements that are present in the range [`first1`, `last1`) but not [`first2`, `last2`). If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, the last $\max(m - n, 0)$ elements from [`first1`, `last1`) are included in the sorted difference, in order. Of those equivalent elements, the first $\min(m, n)$ elements in both ranges are considered *skipped*. An element from the second range is also considered skipped if it compares less than the $\min(N + 1, M)^{\text{th}}$ element of the sorted difference. Copies the first N elements of the sorted difference to the range [`result`, `result +` N).

4 *Returns*:

(4.1) — `result_last` for the overloads in namespace `std`.

(4.2) — `{last1, result +` N`}` for the non-parallel overloads in namespace `ranges`.

(4.3) — For the parallel algorithm overloads in namespace `ranges`:

(4.3.1) — `{last1, first2 +` B`, result +` N`}`, if N is equal to M, where B is the number of skipped elements in [`first2`, `last2`).

(4.3.2) — Otherwise, `{first1 +` A`, first2 +` B`, result_last}`, where A and B are the numbers of copied or skipped elements in [`first1`, `last1`) and [`first2`, `last2`), respectively.

5 *Complexity*: At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8).

26.8.7.6 `set_symmetric_difference` [set.symmetric.difference]

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator>
  constexpr OutputIterator
    set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
                             InputIterator2 first2, InputIterator2 last2,
                             OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
  ForwardIterator
    set_symmetric_difference(ExecutionPolicy&& exec,
                             ForwardIterator1 first1, ForwardIterator1 last1,
                             ForwardIterator2 first2, ForwardIterator2 last2,
                             ForwardIterator result);
```

```
template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>

```

1 Let:

(1.1) — `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names;

(1.2) — M be the number of elements in the sorted symmetric difference (see below);

(1.3) — `result_last` be `result +` M for the overloads with no parameter `result_last` or `result_r`;

(1.4) — N be min(M, `result_last - result`).

2 *Preconditions*: The ranges [`first1`, `last1`) and [`first2`, `last2`) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

3 *Effects*: Constructs a sorted symmetric difference of the elements from the two ranges; that is, the set of elements that are present in exactly one of [`first1`, `last1`) and [`first2`, `last2`). If [`first1`, `last1`) contains m elements that are equivalent to each other and [`first2`, `last2`) contains n elements that are equivalent to them, then $|m - n|$ of those elements are included in the symmetric difference: the last $m - n$ of these elements from [`first1`, `last1`), in order, if $m > n$, and the last $n - m$ of these elements

from [first2, last2), in order, if $m < n$. If $N < M$, a non-copied element is considered *skipped* if it compares less than or equivalent to the $(N+1)^{\text{th}}$ element of the sorted symmetric difference, unless it is from the same range as that element and does not precede it. Copies the first N elements of the sorted symmetric difference to the range [result, result + N).

4 *Returns*:

(4.1) — result_last for the overloads in namespace std.

(4.2) — {last1, last2, result + N} for the overloads in namespace ranges, if N is equal to $M + K$.

(4.3) — Otherwise, {first1 + A, first2 + B, result_last} for the overloads in namespace ranges, where A and B are the numbers of copied or skipped elements in [first1, last1) and [first2, last2), respectively.

5 *Complexity*: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications of each projection.

6 *Remarks*: Stable (16.4.6.8).

26.8.8 Heap operations [alg.heap.operations]

26.8.8.1 General [alg.heap.operations.general]

1 A random access range [a, b) is a *heap with respect to comp and proj* for a comparator and projection comp and proj if its elements are organized such that:

(1.1) — With N = b - a, for all i, $0 < i < N$, bool(invoke(comp, invoke(proj, a[$\lfloor \frac{i-1}{2} \rfloor$]), invoke(proj, a[$i$]))) is false.

(1.2) — *a may be removed by pop_heap, or a new element added by push_heap, in $\mathcal{O}(\log N)$ time.

2 These properties make heaps useful as priority queues.

3 make_heap converts a range into a heap and sort_heap turns a heap into a sorted sequence.

26.8.8.2 push_heap [push.heap]

```
template<class RandomAccessIterator>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2 *Preconditions*: The range [first, last - 1) is a valid heap with respect to comp and proj. For the overloads in namespace std, RandomAccessIterator meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of *first meets the *Cpp17MoveConstructible* requirements (Table 31) and the *Cpp17MoveAssignable* requirements (Table 33).

3 *Effects*: Places the value in the location last - 1 into the resulting heap [first, last).

4 *Returns*: last for the overloads in namespace ranges.

5 *Complexity*: At most log(last - first) comparisons and twice as many projections.

26.8.8.3 pop_heap [pop.heap]

```
template<class RandomAccessIterator>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
  constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                          Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range [`first`, `last`) is a valid non-empty heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Swaps the value in the location `first` with the value in the location `last - 1` and makes [`first`, `last - 1`) into a heap with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2\log(\texttt{last - first})$ comparisons and twice as many projections.

26.8.8.4 `make_heap` [make.heap]

```
template<class RandomAccessIterator>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Constructs a heap with respect to `comp` and `proj` out of the range [`first`, `last`).

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $3(\texttt{last - first})$ comparisons and twice as many projections.

26.8.8.5 `sort_heap` [sort.heap]

```
template<class RandomAccessIterator>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                           Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
    ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2 *Preconditions*: The range [`first`, `last`) is a valid heap with respect to `comp` and `proj`. For the overloads in namespace `std`, `RandomAccessIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3) and the type of `*first` meets the *Cpp17MoveConstructible* (Table 31) and *Cpp17MoveAssignable* (Table 33) requirements.

3 *Effects*: Sorts elements in the heap [`first`, `last`) with respect to `comp` and `proj`.

4 *Returns*: `last` for the overloads in namespace `ranges`.

5 *Complexity*: At most $2N \log N$ comparisons, where $N =$ `last - first`, and twice as many projections.

26.8.8.6 `is_heap` [is.heap]

```
template<class RandomAccessIterator>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

1 *Effects*: Equivalent to: `return is_heap_until(first, last) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last);
```

2 *Effects*: Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```
template<class RandomAccessIterator, class Compare>
  constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                         Compare comp);
```

3 *Effects*: Equivalent to: `return is_heap_until(first, last, comp) == last;`

```
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  bool is_heap(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last,
               Compare comp);
```

4 *Effects*: Equivalent to:

```
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});
```

5 *Effects*: Equivalent to: `return ranges::is_heap_until(first, last, comp, proj) == last;`

```
template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  bool ranges::is_heap(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  bool ranges::is_heap(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

6 *Effects*: Equivalent to:

```
return ranges::is_heap_until(std::forward<Ep>(exec), first, last, comp, proj) == last;
```

```
template<class RandomAccessIterator>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
  constexpr RandomAccessIterator
    is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                  RandomAccessIterator first, RandomAccessIterator last,
                  Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  I ranges::is_heap_until(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  borrowed_iterator_t<R>
    ranges::is_heap_until(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

7 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

8 *Returns*: The last iterator `i` in [`first`, `last`] for which the range [`first`, `i`) is a heap with respect to `comp` and `proj`.

9 *Complexity*: Linear.

26.8.9 Minimum and maximum [alg.min.max]

```
template<class T>
  constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

1 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

2 *Returns*: The smaller value. Returns the first argument when the arguments are equivalent.

3 *Complexity*: Exactly one comparison and two applications of the projection, if any.

4 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T min(initializer_list<T> r);
template<class T, class Compare>
  constexpr T min(initializer_list<T> r, Compare comp);
```

```
template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::min(R&& r, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  range_value_t<R>
    ranges::min(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

5 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

6 *Returns*: The smallest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the smallest.

7 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

8 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
  constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

9 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

10 *Returns*: The larger value. Returns the first argument when the arguments are equivalent.

11 *Complexity*: Exactly one comparison and two applications of the projection, if any.

12 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr T max(initializer_list<T> r);
template<class T, class Compare>
  constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr range_value_t<R>
    ranges::max(R&& r, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  range_value_t<R>
    ranges::max(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

13 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

14 *Returns*: The largest value in the input range. Returns a copy of the leftmost element when several elements are equivalent to the largest.

15 *Complexity*: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the projection, if any.

16 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
  constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<const T&>
    ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
```

17 *Preconditions*: For the first form, `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

18 *Returns*: `{b, a}` if `b` is smaller than `a`, and `{a, b}` otherwise.

19 *Complexity*: Exactly one comparison and two applications of the projection, if any.

20 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class T>
  constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
  constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_result<T>
    ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
template<input_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  constexpr ranges::minmax_result<range_value_t<R>>
    ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
  ranges::minmax_result<range_value_t<R>>
    ranges::minmax(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

21 *Preconditions*: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the *Cpp17CopyConstructible* requirements. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

22 *Returns*: Let `X` be the return type. Returns `X{x, y}`, where `x` is a copy of the leftmost element with the smallest value and `y` a copy of the rightmost element with the largest value in the input range.

23 *Complexity*: At most (3/2)`ranges::distance(r)` applications of the corresponding predicate and twice as many applications of the projection, if any.

24 *Remarks*: An invocation may explicitly specify an argument for the template parameter `T` of the overloads in namespace `std`.

```
template<class ForwardIterator>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
  constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator min_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  I ranges::min_element(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R,
         class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  borrowed_iterator_t<R>
    ranges::min_element(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

25 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

26 *Returns*: The first iterator `i` in the range $[$`first`, `last`$)$ such that for every iterator `j` in the range $[$`first`, `last`$)$,

```
bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))
```

is `false`. Returns `last` if `first == last`.

27 *Complexity*: Exactly $\max($`last - first - 1`$, 0)$ comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  ForwardIterator max_element(ExecutionPolicy&& exec,
                              ForwardIterator first, ForwardIterator last,
                              Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R>
    ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  I ranges::max_element(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R,
         class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  borrowed_iterator_t<R>
    ranges::max_element(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

28 Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

29 *Returns*: The first iterator `i` in the range [`first`, `last`) such that for every iterator `j` in the range [`first`, `last`),

```
bool(invoke(comp, invoke(proj, *i), invoke(proj, *j)))
```

is `false`. Returns `last` if `first == last`.

30 *Complexity*: Exactly max(`last - first - 1`, 0) comparisons and twice as many projections.

```
template<class ForwardIterator>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last);
template<class ExecutionPolicy, class ForwardIterator>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
  constexpr pair<ForwardIterator, ForwardIterator>
    minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
template<class ExecutionPolicy, class ForwardIterator, class Compare>
  pair<ForwardIterator, ForwardIterator>
    minmax_element(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_element_result<I>
    ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr ranges::minmax_element_result<borrowed_iterator_t<R>>
    ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});

template<execution-policy Ep, random_access_iterator I, sized_sentinel_for<I> S,
         class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
  ranges::minmax_element_result<I>
    ranges::minmax_element(Ep&& exec, I first, S last, Comp comp = {}, Proj proj = {});
template<execution-policy Ep, sized-random-access-range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
  ranges::minmax_element_result<borrowed_iterator_t<R>>
    ranges::minmax_element(Ep&& exec, R&& r, Comp comp = {}, Proj proj = {});
```

31 *Returns*: `{first, first}` if [`first`, `last`) is empty, otherwise `{m, M}`, where `m` is the first iterator in [`first`, `last`) such that no iterator in the range refers to a smaller element, and where `M` is the last iterator[184] in [`first`, `last`) such that no iterator in the range refers to a larger element.

32 *Complexity*: Let N be `last - first`. At most $\max(\lfloor \frac{3}{2}(N-1) \rfloor, 0)$ comparisons and twice as many applications of the projection, if any.

26.8.10 Bounded value [alg.clamp]

```
template<class T>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi);
template<class T, class Compare>
  constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);
template<class T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
  constexpr const T&
    ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` for the overloads with no parameter `comp`, and let `proj` be `identity{}` for the overloads with no parameter `proj`.

184) This behavior intentionally differs from `max_element`.

2 *Preconditions*: `bool(invoke(comp, invoke(proj, hi), invoke(proj, lo)))` is `false`. For the first form, type `T` meets the *Cpp17LessThanComparable* requirements (Table 29).

3 *Returns*: `lo` if `bool(invoke(comp, invoke(proj, v), invoke(proj, lo)))` is `true`, `hi` if `bool(invoke(comp, invoke(proj, hi), invoke(proj, v)))` is `true`, otherwise `v`.

4 [*Note 1*: If NaN is avoided, `T` can be a floating-point type. — *end note*]

5 *Complexity*: At most two comparisons and three applications of the projection.

26.8.11 Lexicographical comparison [alg.lex.comparison]

```
template<class InputIterator1, class InputIterator2>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
  constexpr bool
    lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, InputIterator2 last2,
                            Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
  bool
    lexicographical_compare(ExecutionPolicy&& exec,
                            ForwardIterator1 first1, ForwardIterator1 last1,
                            ForwardIterator2 first2, ForwardIterator2 last2,
                            Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
                                    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<input_range R1, input_range R2, class Proj1 = identity,
         class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  constexpr bool
    ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
                                    Proj1 proj1 = {}, Proj2 proj2 = {});

template<execution-policy Ep, random_access_iterator I1, sized_sentinel_for<I1> S1,
         random_access_iterator I2, sized_sentinel_for<I2> S2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<I1, Proj1>,
                                    projected<I2, Proj2>> Comp = ranges::less>
  bool ranges::lexicographical_compare(Ep&& exec, I1 first1, S1 last1, I2 first2, S2 last2,
                                       Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
template<execution-policy Ep, sized-random-access-range R1, sized-random-access-range R2,
         class Proj1 = identity, class Proj2 = identity,
         indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
                                    projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
  bool ranges::lexicographical_compare(Ep&& exec, R1&& r1, R2&& r2, Comp comp = {},
                                       Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 *Returns*: `true` if and only if the sequence of elements defined by the range [`first1`, `last1`) is lexicographically less than the sequence of elements defined by the range [`first2`, `last2`).

2 *Complexity*: At most 2 min(`last1 - first1`, `last2 - first2`) applications of the corresponding comparison and each projection, if any.

3 *Remarks*: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

4 [*Example 1*: `ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2)` can be implemented as:

```
for (; first1 != last1 && first2 != last2; ++first1, (void)++first2) {
  if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
  if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
```

— *end example*]

5 [*Note 1*: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — *end note*]

26.8.12 Three-way comparison algorithms [alg.three.way]

```
template<class InputIterator1, class InputIterator2, class Cmp>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2,
                                      Cmp comp)
      -> decltype(comp(*b1, *b2));
```

1 Let N be min(`e1 - b1`, `e2 - b2`). Let $E(n)$ be `comp(*(b1 + n), *(b2 + n))`.

2 *Mandates*: `decltype(comp(*b1, *b2))` is a comparison category type.

3 *Returns*: $E(i)$, where i is the smallest integer in $[0, N)$ such that $E(i)$ `!= 0` is `true`, or `(e1 - b1) <=> (e2 - b2)` if no such integer exists.

4 *Complexity*: At most N applications of `comp`.

```
template<class InputIterator1, class InputIterator2>
  constexpr auto
    lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
                                      InputIterator2 b2, InputIterator2 e2);
```

5 *Effects*: Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

26.8.13 Permutation generators [alg.permutation.generators]

```
template<class BidirectionalIterator>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool next_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::next_permutation_result<I>
    ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
    ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

3 *Effects*: Takes a sequence defined by the range [`first`, `last`) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 *Returns*: Let `B` be `true` if a next permutation was found and otherwise `false`. Returns:

(4.1) — `B` for the overloads in namespace `std`.

(4.2) — `{ last, B }` for the overloads in namespace `ranges`.

5 *Complexity*: At most `(last - first) / 2` swaps.

```
template<class BidirectionalIterator>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
  constexpr bool prev_permutation(BidirectionalIterator first,
                                  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr ranges::prev_permutation_result<I>
    ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
    ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

6 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

7 *Preconditions*: For the overloads in namespace `std`, `BidirectionalIterator` meets the *Cpp17ValueSwappable* requirements (16.4.4.3).

8 *Effects*: Takes a sequence defined by the range [`first`, `last`) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `comp` and `proj`. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 *Returns*: Let `B` be `true` if a previous permutation was found and otherwise `false`. Returns:

(9.1) — `B` for the overloads in namespace `std`.

(9.2) — `{ last, B }` for the overloads in namespace `ranges`.

10 *Complexity*: At most `(last - first) / 2` swaps.

26.9 Header `<numeric>` synopsis [numeric.ops.overview]

```

26.10 Generalized numeric operations [numeric.ops]

26.10.1 General [numeric.ops.general]

1 [*Note 1*: The use of closed ranges as well as semi-open ranges to specify requirements throughout 26.10 is intentional. — *end note*]

26.10.2 Definitions [numerics.defns]

1 Define *GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aN) as follows:

(1.1) — a1 when N is 1, otherwise

(1.2) — op(*GENERALIZED_NONCOMMUTATIVE_SUM*(op, a1, ..., aK), *GENERALIZED_NONCOMMUTATIVE_SUM*(op, aM, ..., aN)) for any K where $1 < K + 1 = M \leq N$.

2 Define *GENERALIZED_SUM*(op, a1, ..., aN) as *GENERALIZED_NONCOMMUTATIVE_SUM*(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

26.10.3 Accumulate [accumulate]

```
template<class InputIterator, class T>
  constexpr T accumulate(InputIterator first, InputIterator last, T init);
```

```
template<class InputIterator, class T, class BinaryOperation>
  constexpr T accumulate(InputIterator first, InputIterator last, T init,
                         BinaryOperation binary_op);
```

1 *Preconditions*: `T` meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the range [`first`, `last`], `binary_op` neither modifies elements nor invalidates iterators or subranges.[185]

2 *Effects*: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifies it with `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` for every iterator `i` in the range [`first`, `last`) in order.[186]

26.10.4 Reduce [reduce]

```
template<class InputIterator>
  constexpr typename iterator_traits<InputIterator>::value_type
    reduce(InputIterator first, InputIterator last);
```

1 *Effects*: Equivalent to:

```
return reduce(first, last,
              typename iterator_traits<InputIterator>::value_type{});
```

```
template<class ExecutionPolicy, class ForwardIterator>
  typename iterator_traits<ForwardIterator>::value_type
    reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last);
```

2 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
              typename iterator_traits<ForwardIterator>::value_type{});
```

```
template<class InputIterator, class T>
  constexpr T reduce(InputIterator first, InputIterator last, T init);
```

3 *Effects*: Equivalent to:

```
return reduce(first, last, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator, class T>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init);
```

4 *Effects*: Equivalent to:

```
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());
```

```
template<class InputIterator, class T, class BinaryOperation>
  constexpr T reduce(InputIterator first, InputIterator last, T init,
                     BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
  T reduce(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, T init,
           BinaryOperation binary_op);
```

5 *Mandates*: All of

(5.1) — `binary_op(init, *first)`,

(5.2) — `binary_op(*first, init)`,

(5.3) — `binary_op(init, init)`, and

(5.4) — `binary_op(*first, *first)`

are convertible to `T`.

6 *Preconditions*:

(6.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

185) The use of fully closed ranges is intentional.

186) `accumulate` is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.

(6.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the range [`first`, `last`].

7 *Returns*: *`GENERALIZED_SUM`*`(binary_op, init, *i, ...)` for every `i` in [`first`, `last`).

8 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

9 [*Note 1*: The difference between `reduce` and `accumulate` is that `reduce` applies `binary_op` in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative `binary_op` such as floating-point addition. — *end note*]

26.10.5 Inner product [inner.product]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init);
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
                            InputIterator2 first2, T init,
                            BinaryOperation1 binary_op1,
                            BinaryOperation2 binary_op2);
```

1 *Preconditions*: `T` meets the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. In the ranges [`first1`, `last1`] and [`first2`, `first2 + (last1 - first1)`] `binary_op1` and `binary_op2` neither modifies elements nor invalidates iterators or subranges.[187]

2 *Effects*: Computes its result by initializing the accumulator `acc` with the initial value `init` and then modifying it with `acc = std::move(acc) + (*i1) * (*i2)` or `acc = binary_op1(std::move(acc), binary_op2(*i1, *i2))` for every iterator `i1` in the range [`first1`, `last1`) and iterator `i2` in the range [`first2`, `first2 + (last1 - first1)`) in order.

26.10.6 Transform reduce [transform.reduce]

```
template<class InputIterator1, class InputIterator2, class T>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init);
```

1 *Effects*: Equivalent to:

```
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init);
```

2 *Effects*: Equivalent to:

```
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                        first1, last1, first2, init, plus<>(), multiplies<>());
```

```
template<class InputIterator1, class InputIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                               InputIterator2 first2,
                               T init,
                               BinaryOperation1 binary_op1,
                               BinaryOperation2 binary_op2);
```

187) The use of fully closed ranges is intentional.

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation1, class BinaryOperation2>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator1 first1, ForwardIterator1 last1,
                     ForwardIterator2 first2,
                     T init,
                     BinaryOperation1 binary_op1,
                     BinaryOperation2 binary_op2);
```

3 *Mandates*: All of

(3.1) — `binary_op1(init, init)`,

(3.2) — `binary_op1(init, binary_op2(*first1, *first2))`,

(3.3) — `binary_op1(binary_op2(*first1, *first2), init)`, and

(3.4) — `binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))`

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(4.2) — Neither `binary_op1` nor `binary_op2` invalidates subranges, nor modifies elements in the ranges [`first1`, `last1`] and [`first2`, `first2 + (last1 - first1)`].

5 *Returns*:

GENERALIZED_SUM(`binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...`)

for every iterator `i` in [`first1`, `last1`).

6 *Complexity*: $\mathcal{O}$(`last1 - first1`) applications each of `binary_op1` and `binary_op2`.

```
template<class InputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                               BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator, class T,
         class BinaryOperation, class UnaryOperation>
  T transform_reduce(ExecutionPolicy&& exec,
                     ForwardIterator first, ForwardIterator last,
                     T init, BinaryOperation binary_op, UnaryOperation unary_op);
```

7 *Mandates*: All of

(7.1) — `binary_op(init, init)`,

(7.2) — `binary_op(init, unary_op(*first))`,

(7.3) — `binary_op(unary_op(*first), init)`, and

(7.4) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

8 *Preconditions*:

(8.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(8.2) — Neither `unary_op` nor `binary_op` invalidates subranges, nor modifies elements in the range [`first`, `last`].

9 *Returns*:

GENERALIZED_SUM(`binary_op, init, unary_op(*i), ...`)

for every iterator `i` in [`first`, `last`).

10 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

11 [*Note 1*: `transform_reduce` does not apply `unary_op` to `init`. — *end note*]

26.10.7 Partial sum [partial.sum]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    partial_sum(InputIterator first, InputIterator last,
                OutputIterator result, BinaryOperation binary_op);
```

1 *Mandates*: `InputIterator`'s value type is constructible from `*first`. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` is implicitly convertible to `InputIterator`'s value type. `acc` is writable (24.3.1) to `result`.

2 *Preconditions*: In the ranges [`first`, `last`] and [`result`, `result + (last - first)`] `binary_op` neither modifies elements nor invalidates iterators or subranges.[188]

3 *Effects*: For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in [`first + 1`, `last`) in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

4 *Returns*: `result + (last - first)`.

5 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

6 *Remarks*: `result` may be equal to `first`.

26.10.8 Exclusive scan [exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init);
```

1 *Effects*: Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init);
```

2 *Effects*: Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
                      first, last, result, init, plus<>());
```

```
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
  constexpr OutputIterator
    exclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, T init, BinaryOperation binary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
  ForwardIterator2
    exclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, T init, BinaryOperation binary_op);
```

3 *Mandates*: All of

(3.1) — `binary_op(init, init)`,

(3.2) — `binary_op(init, *first)`, and

(3.3) — `binary_op(*first, *first)`

188) The use of fully closed ranges is intentional.

are convertible to `T`.

4 *Preconditions*:

(4.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(4.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

5 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

6 *Returns*: The end of the resulting range beginning at `result`.

7 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

8 *Remarks*: `result` may be equal to `first`.

9 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic. — *end note*]

26.10.9 Inclusive scan [inclusive.scan]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result);
```

1 *Effects*: Equivalent to:

```
return inclusive_scan(first, last, result, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result);
```

2 *Effects*: Equivalent to:

```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
  constexpr OutputIterator
    inclusive_scan(InputIterator first, InputIterator last,
                   OutputIterator result, BinaryOperation binary_op, T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
  ForwardIterator2
    inclusive_scan(ExecutionPolicy&& exec,
                   ForwardIterator1 first, ForwardIterator1 last,
                   ForwardIterator2 result, BinaryOperation binary_op, T init);
```

3 Let `U` be the value type of `decltype(first)`.

4 *Mandates*: If `init` is provided, all of

(4.1) — `binary_op(init, init)`,

(4.2) — `binary_op(init, *first)`, and

(4.3) — `binary_op(*first, *first)`

are convertible to `T`; otherwise, `binary_op(*first, *first)` is convertible to `U`.

5 *Preconditions*:

(5.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(5.2) — `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

6 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of

(6.1) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*`(`
`binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))`
if `init` is provided, or

(6.2) — *`GENERALIZED_NONCOMMUTATIVE_SUM`*`(`
`binary_op, *(first + 0), *(first + 1), ..., *(first + K))`
otherwise.

7 *Returns*: The end of the resulting range beginning at `result`.

8 *Complexity*: $\mathcal{O}$(`last - first`) applications of `binary_op`.

9 *Remarks*: `result` may be equal to `first`.

10 [*Note 1*: The difference between `exclusive_scan` and `inclusive_scan` is that `inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `inclusive_scan` can be nondeterministic. — *end note*]

26.10.10 Transform exclusive scan [transform.exclusive.scan]

```
template<class InputIterator, class OutputIterator, class T,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_exclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_exclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result, T init,
                             BinaryOperation binary_op, UnaryOperation unary_op);
```

1 *Mandates*: All of

(1.1) — `binary_op(init, init)`,

(1.2) — `binary_op(init, unary_op(*first))`, and

(1.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`.

2 *Preconditions*:

(2.1) — `T` meets the *Cpp17MoveConstructible* (Table 31) requirements.

(2.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

3 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of:

`GENERALIZED_NONCOMMUTATIVE_SUM``(`
`binary_op, init,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K - 1)))`

4 *Returns*: The end of the resulting range beginning at `result`.

5 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

6 *Remarks*: `result` may be equal to `first`.

7 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the i^{th} input element from the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` can be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — *end note*]

26.10.11 Transform inclusive scan [transform.inclusive.scan]

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op);
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
  constexpr OutputIterator
    transform_inclusive_scan(InputIterator first, InputIterator last,
                             OutputIterator result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
  ForwardIterator2
    transform_inclusive_scan(ExecutionPolicy&& exec,
                             ForwardIterator1 first, ForwardIterator1 last,
                             ForwardIterator2 result,
                             BinaryOperation binary_op, UnaryOperation unary_op,
                             T init);
```

1 Let `U` be the value type of `decltype(first)`.

2 *Mandates*: If `init` is provided, all of

(2.1) — `binary_op(init, init)`,

(2.2) — `binary_op(init, unary_op(*first))`, and

(2.3) — `binary_op(unary_op(*first), unary_op(*first))`

are convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` is convertible to `U`.

3 *Preconditions*:

(3.1) — If `init` is provided, `T` meets the *Cpp17MoveConstructible* (Table 31) requirements; otherwise, `U` meets the *Cpp17MoveConstructible* requirements.

(3.2) — Neither `unary_op` nor `binary_op` invalidates iterators or subranges, nor modifies elements in the ranges [`first`, `last`] or [`result`, `result + (last - first)`].

4 *Effects*: For each integer `K` in [`0`, `last - first`) assigns through `result + K` the value of

(4.1) — *GENERALIZED_NONCOMMUTATIVE_SUM*(
`binary_op, init,`
`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`)
if `init` is provided, or

(4.2) — *GENERALIZED_NONCOMMUTATIVE_SUM*(
`binary_op,`

`unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))`
otherwise.

5 *Returns*: The end of the resulting range beginning at `result`.

6 *Complexity*: $\mathcal{O}$(`last - first`) applications each of `unary_op` and `binary_op`.

7 *Remarks*: `result` may be equal to `first`.

8 [*Note 1*: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_inclusive_scan` includes the i^{th} input element in the i^{th} sum. If `binary_op` is not mathematically associative, the behavior of `transform_inclusive_scan` can be nondeterministic. `transform_inclusive_scan` does not apply `unary_op` to `init`. — *end note*]

26.10.12 Adjacent difference [adjacent.difference]

```
template<class InputIterator, class OutputIterator>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
  constexpr OutputIterator
    adjacent_difference(InputIterator first, InputIterator last,
                        OutputIterator result, BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
  ForwardIterator2
    adjacent_difference(ExecutionPolicy&& exec,
                        ForwardIterator1 first, ForwardIterator1 last,
                        ForwardIterator2 result, BinaryOperation binary_op);
```

1 Let `T` be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

2 *Mandates*:

(2.1) — For the overloads with no `ExecutionPolicy`, `T` is constructible from `*first`. `acc` (defined below) is writable (24.3.1) to the `result` output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to `result`.

(2.2) — For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

3 *Preconditions*:

(3.1) — For the overloads with no `ExecutionPolicy`, `T` meets the *Cpp17MoveAssignable* (Table 33) requirements.

(3.2) — For all overloads, in the ranges [`first`, `last`] and [`result`, `result + (last - first)`], `binary_op` neither modifies elements nor invalidates iterators or subranges.[189]

4 *Effects*: For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in [`first + 1`, `last`) in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

5 For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in [`1`, `last - first - 1`], performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

6 *Returns*: `result + (last - first)`.

7 *Complexity*: Exactly `(last - first) - 1` applications of the binary operation.

189) The use of fully closed ranges is intentional.

8 *Remarks*: For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges [`first`, `last`) and [`result`, `result + (last - first)`) shall not overlap.

26.10.13 Iota [numeric.iota]

```
template<class ForwardIterator, class T>
  constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

1 *Mandates*: `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

2 *Effects*: For each element referred to by the iterator `i` in the range [`first`, `last`), assigns `*i = value` and increments `value` as if by `++value`.

3 *Complexity*: Exactly `last - first` increments and assignments.

```
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
  requires indirectly_writable<O, const T&>
  constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
  constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

4 *Effects*: Equivalent to:

```
while (first != last) {
  *first = as_const(value);
  ++first;
  ++value;
}
return {std::move(first), std::move(value)};
```

26.10.14 Greatest common divisor [numeric.ops.gcd]

```
template<class M, class N>
  constexpr common_type_t<M, N> gcd(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`.

[*Note 1*: These requirements ensure, for example, that `gcd(m, m)` = |`m`| is representable as a value of type `M`. — *end note*]

3 *Returns*: Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of |`m`| and |`n`|.

4 *Throws*: Nothing.

26.10.15 Least common multiple [numeric.ops.lcm]

```
template<class M, class N>
  constexpr common_type_t<M, N> lcm(M m, N n);
```

1 *Mandates*: `M` and `N` both are integer types other than *cv* `bool`.

2 *Preconditions*: |`m`| and |`n`| are representable as a value of `common_type_t<M, N>`. The least common multiple of |`m`| and |`n`| is representable as a value of type `common_type_t<M, N>`.

3 *Returns*: Zero when either `m` or `n` is zero. Otherwise, returns the least common multiple of |`m`| and |`n`|.

4 *Throws*: Nothing.

26.10.16 Midpoint [numeric.ops.midpoint]

```
template<class T>
  constexpr T midpoint(T a, T b) noexcept;
```

1 *Constraints*: `T` is an arithmetic type other than *cv* `bool`.

2 *Returns*: Half the sum of `a` and `b`. If `T` is an integer type and the sum is odd, the result is rounded towards `a`.

3 *Remarks*: No overflow occurs. If `T` is a floating-point type, at most one inexact operation occurs.

```
template<class T>
  constexpr T* midpoint(T* a, T* b);
```

4 *Constraints*: `T` is an object type.

5 *Mandates*: `T` is a complete type.

6 *Preconditions*: `a` and `b` point to, respectively, elements i and j of the same array object `x`.

[*Note 1*: As specified in 6.9.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. — *end note*]

7 *Returns*: A pointer to array element $i + \frac{j-i}{2}$ of `x`, where the result of the division is truncated towards zero.

26.10.17 Saturation arithmetic [numeric.sat]

26.10.17.1 Arithmetic functions [numeric.sat.func]

1 In the following descriptions, an arithmetic operation is performed as a mathematical operation with infinite range and then it is determined whether the mathematical result fits into the result type.

```
template<class T>
  constexpr T saturating_add(T x, T y) noexcept;
```

2 *Constraints*: `T` is a signed or unsigned integer type (6.9.2).

3 *Returns*: If `x + y` is representable as a value of type `T`, `x + y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x + y`.

```
template<class T>
  constexpr T saturating_sub(T x, T y) noexcept;
```

4 *Constraints*: `T` is a signed or unsigned integer type (6.9.2).

5 *Returns*: If `x - y` is representable as a value of type `T`, `x - y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x - y`.

```
template<class T>
  constexpr T saturating_mul(T x, T y) noexcept;
```

6 *Constraints*: `T` is a signed or unsigned integer type (6.9.2).

7 *Returns*: If `x` × `y` is representable as a value of type `T`, `x` × `y`; otherwise, either the largest or smallest representable value of type `T`, whichever is closer to the value of `x` × `y`.

```
template<class T>
  constexpr T saturating_div(T x, T y) noexcept;
```

8 *Constraints*: `T` is a signed or unsigned integer type (6.9.2).

9 *Preconditions*: `y != 0` is `true`.

10 *Returns*: If `T` is a signed integer type and `x == numeric_limits<T>::min() && y == -1` is `true`, `numeric_limits<T>::max()`, otherwise, `x / y`.

11 *Remarks*: A function call expression that violates the precondition in the *Preconditions* element is not a core constant expression (7.7.2).

26.10.17.2 Casting [numeric.sat.cast]

```
template<class R, class T>
  constexpr R saturating_cast(T x) noexcept;
```

1 *Constraints*: `R` and `T` are signed or unsigned integer types (6.9.2).

2 *Returns*: If `x` is representable as a value of type `R`, `x`; otherwise, either the largest or smallest representable value of type `R`, whichever is closer to the value of `x`.

26.11 Specialized <memory> algorithms [specialized.algorithms]

26.11.1 General [specialized.algorithms.general]

1 The contents specified in 26.11 are declared in the header `<memory>` (20.2.2).

2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement *new-expression* (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

3 [*Note 1*: When new objects are created by the algorithms specified in 26.11, the lifetime ends for any existing objects (including potentially-overlapping subobjects 6.8.2) in storage that is reused 6.8.4. — *end note*]

4 Some algorithms specified in 26.11 make use of the following exposition-only function templates:

```
template<class T>
  constexpr void* voidify(T& obj) noexcept {
    return addressof(obj);
  }

template<class I>
  constexpr decltype(auto) deref-move(I& it) {
    if constexpr (is_lvalue_reference_v<decltype(*it)>)
      return std::move(*it);
    else
      return *it;
  }
```

26.11.2 Special memory concepts [special.mem.concepts]

1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

```
template<class I>
concept nothrow-input-iterator = // exposition only
  input_iterator<I> &&
  is_lvalue_reference_v<iter_reference_t<I>> &&
  same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

2 A type `I` models *`nothrow-input-iterator`* only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

3 [*Note 1*: This concept allows some `input_iterator` (24.3.4.9) operations to throw exceptions. — *end note*]

```
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

4 Types `S` and `I` model *`nothrow-sentinel-for`* only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type `I` and `S`.

5 [*Note 2*: This concept allows some `sentinel_for` (24.3.4.7) operations to throw exceptions. — *end note*]

```
template<class S, class I>
concept nothrow-sized-sentinel-for = // exposition only
  nothrow-sentinel-for<S, I> &&
  sized_sentinel_for<S, I>;
```

6 Types `S` and `I` model *`nothrow-sized-sentinel-for`* only if no exceptions are thrown from the `-` operator for valid values of type `I` and `S`.

7 [*Note 3*: This concept allows some `sized_sentinel_for` (24.3.4.8) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-input-range = // exposition only
  range<R> &&
  nothrow-input-iterator<iterator_t<R>> &&
  nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

8 A type `R` models *`nothrow-input-range`* only if no exceptions are thrown from calls to `ranges::begin` and `ranges::end` on an object of type `R`.

```
template<class I>
concept nothrow-forward-iterator = // exposition only
  nothrow-input-iterator<I> &&
  forward_iterator<I> &&
  nothrow-sentinel-for<I, I>;
```

9 [*Note 4*: This concept allows some `forward_iterator` (24.3.4.11) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-forward-range = // exposition only
  nothrow-input-range<R> &&
  nothrow-forward-iterator<iterator_t<R>>;

template<class I>
concept nothrow-bidirectional-iterator = // exposition only
  nothrow-forward-iterator<I> &&
  bidirectional_iterator<I>;
```

10 A type `I` models *`nothrow-bidirectional-iterator`* only if no exceptions are thrown from decrementing valid iterators.

[*Note 5*: This concept allows some `bidirectional_iterator` (24.3.4.12) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-bidirectional-range = // exposition only
  nothrow-forward-range<R> &&
  nothrow-bidirectional-iterator<iterator_t<R>>;

template<class I>
concept nothrow-random-access-iterator = // exposition only
  nothrow-bidirectional-iterator<I> &&
  random_access_iterator<I> &&
  nothrow-sized-sentinel-for<I, I>;
```

11 A type `I` models *`nothrow-random-access-iterator`* only if no exceptions are thrown from comparisons of valid iterators, or the `-`, `+`, `-=`, `+=`, `[]` operators on valid values of type `I` and `iter_difference_t<I>`.

[*Note 6*: This concept allows some `random_access_iterator` (24.3.4.13) operations to throw exceptions. — *end note*]

```
template<class R>
concept nothrow-random-access-range = // exposition only
  nothrow-bidirectional-range<R> &&
  nothrow-random-access-iterator<iterator_t<R>>;

template<class R>
concept nothrow-sized-random-access-range = // exposition only
  nothrow-random-access-range<R> && sized_range<R>;
```

12 A type `R` models *`nothrow-sized-random-access-range`* only if no exceptions are thrown from the call to `ranges::size` on an object of type `R`.

26.11.3 `uninitialized_default_construct` [uninitialized.construct.default]

```
template<class NoThrowForwardIterator>
  constexpr void uninitialized_default_construct(NoThrowForwardIterator first,
                                                 NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_default_construct(I first, S last);
```

```
  template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    constexpr borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator
    uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type;
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_default_construct(counted_iterator(first, n),
                                       default_sentinel).base();
```

26.11.4 `uninitialized_value_construct` [uninitialized.construct.value]

```
template<class NoThrowForwardIterator>
  constexpr void uninitialized_value_construct(NoThrowForwardIterator first,
                                                NoThrowForwardIterator last);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type();
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_value_construct(I first, S last);
  template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    constexpr borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator
    uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);
```

3 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type();
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    constexpr I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_value_construct(counted_iterator(first, n),
                                     default_sentinel).base();
```

26.11.5 `uninitialized_copy` [uninitialized.copy]

```
template<class InputIterator, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                                      NoThrowForwardIterator result);
```

1 *Preconditions*: `result` + [0, `(last - first)`) does not overlap with [`first`, `last`).

2 *Effects*: Equivalent to:

```
for (; first != last; ++result, (void)++first)
  ::new (voidify(*result)) iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

3 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    constexpr uninitialized_copy_result<I, O>
      uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    constexpr uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_copy(IR&& in_range, OR&& out_range);
}
```

4 *Preconditions*: [`ofirst`, `olast`) does not overlap with [`ifirst`, `ilast`).

5 *Effects*: Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
  ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
return {std::move(ifirst), ofirst};
```

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                                        NoThrowForwardIterator result);
```

6 *Preconditions*: `result` + [0, `n`) does not overlap with `first` + [0, `n`).

7 *Effects*: Equivalent to:

```
for (; n > 0; ++result, (void)++first, --n)
  ::new (voidify(*result)) iterator_traits<NoThrowForwardIterator>::value_type(*first);
```

8 *Returns*: `result`.

```
namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    constexpr uninitialized_copy_n_result<I, O>
      uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

9 *Preconditions*: [`ofirst`, `olast`) does not overlap with `ifirst` + [0, `n`).

10 *Effects*: Equivalent to:

```
auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                            default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

26.11.6 `uninitialized_move` [uninitialized.move]

```
template<class InputIterator, class NoThrowForwardIterator>
  constexpr NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                                      NoThrowForwardIterator result);
```

1 *Preconditions*: `result` + [`0`, `(last - first)`) does not overlap with [`first`, `last`).

2 *Effects*: Equivalent to:

```
for (; first != last; (void)++result, ++first)
  ::new (voidify(*result))
    iterator_traits<NoThrowForwardIterator>::value_type(deref-move(first));
return result;
```

```
namespace ranges {
  template<input_iterator I, sentinel_for<I> S1,
           nothrow-forward-iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    constexpr uninitialized_move_result<I, O>
      uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
  template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
    constexpr uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
      uninitialized_move(IR&& in_range, OR&& out_range);
}
```

3 *Preconditions*: [`ofirst`, `olast`) does not overlap with [`ifirst`, `ilast`).

4 *Effects*: Equivalent to:

```
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
  ::new (voidify(*ofirst))
    remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst));
return {std::move(ifirst), ofirst};
```

5 [*Note 1*: If an exception is thrown, some objects in the range [`ifirst`, `ilast`) are left in a valid, but unspecified state. — *end note*]

```
template<class InputIterator, class Size, class NoThrowForwardIterator>
  constexpr pair<InputIterator, NoThrowForwardIterator>
    uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);
```

6 *Preconditions*: `result` + [`0`, `n`) does not overlap with `first` + [`0`, `n`).

7 *Effects*: Equivalent to:

```
for (; n > 0; ++result, (void)++first, --n)
  ::new (voidify(*result))
    iterator_traits<NoThrowForwardIterator>::value_type(deref-move(first));
return {first, result};
```

```
namespace ranges {
  template<input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    constexpr uninitialized_move_n_result<I, O>
      uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}
```

8 *Preconditions*: [`ofirst`, `olast`) does not overlap with `ifirst` + [`0`, `n`).

9 *Effects*: Equivalent to:

```
auto t = uninitialized_move(counted_iterator(std::move(ifirst), n),
                            default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};
```

10 [*Note 2*: If an exception is thrown, some objects in the range `ifirst` + [`0`, `n`) are left in a valid but unspecified state. — *end note*]

26.11.7 `uninitialized_fill` [uninitialized.fill]

```
template<class NoThrowForwardIterator,
         class T = iterator_traits<NoThrowForwardIterator>::value_type>
  constexpr void uninitialized_fill(NoThrowForwardIterator first,
                                    NoThrowForwardIterator last, const T& x);
```

1 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type(x);
```

```
namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T = iter_value_t<I>>
    requires constructible_from<iter_value_t<I>, const T&>
    constexpr I uninitialized_fill(I first, S last, const T& x);
  template<nothrow-forward-range R, class T = range_value_t<R>>
    requires constructible_from<range_value_t<R>, const T&>
    constexpr borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
return first;
```

```
template<class NoThrowForwardIterator, class Size,
         class T = iterator_traits<NoThrowForwardIterator>::value_type>
  constexpr NoThrowForwardIterator
    uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);
```

3 *Effects*: Equivalent to:

```
for (; n--; ++first)
  ::new (voidify(*first)) iterator_traits<NoThrowForwardIterator>::value_type(x);
return first;
```

```
namespace ranges {
  template<nothrow-forward-iterator I, class T = iter_value_t<I>>
    requires constructible_from<iter_value_t<I>, const T&>
    constexpr I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}
```

4 *Effects*: Equivalent to:

```
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();
```

26.11.8 `construct_at` [specialized.construct]

```
template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
  template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
}
```

1 *Constraints*: `is_unbounded_array_v<T>` is `false`. The expression `::new (declval<void*>()) T(declval<Args>()...)` is well-formed when treated as an unevaluated operand (7.2.3).

2 *Mandates*: If `is_array_v<T>` is `true`, `sizeof...(Args)` is zero.

3 *Effects*: Equivalent to:

```
if constexpr (is_array_v<T>)
  return ::new (voidify(*location)) T[1]();
else
  return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```

26.11.9 `destroy` [specialized.destroy]

```
template<class T>
  constexpr void destroy_at(T* location);
namespace ranges {
  template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}
```

1 *Effects*:

(1.1) — If `T` is an array type, equivalent to `destroy(begin(*location), end(*location))`.

(1.2) — Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
  constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
```

```
namespace ranges {
  template<nothrow-input-iterator I, nothrow-sentinel-for<I> S>
    requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
  template<nothrow-input-range R>
    requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3 *Effects*: Equivalent to:

```
for (; first != last; ++first)
  destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
  constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4 *Effects*: Equivalent to:

```
for (; n > 0; (void)++first, --n)
  destroy_at(addressof(*first));
return first;
```

```
namespace ranges {
  template<nothrow-input-iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5 *Effects*: Equivalent to:

```
return destroy(counted_iterator(std::move(first), n), default_sentinel).base();
```

26.12 Specialized `<random>` algorithms [alg.rand]

26.12.1 General [alg.rand.general]

1 The contents specified in 26.12 are declared in the header `<random>` (29.5.2).

26.12.2 `generate_random` [alg.rand.generate]

```
template<class R, class G>
  requires output_range<R, invoke_result_t<G&>> && uniform_random_bit_generator<remove_cvref_t<G>>
  constexpr borrowed_iterator_t<R> ranges::generate_random(R&& r, G&& g);
```

1 *Effects*:

(1.1) — Calls `g.generate_random(std::forward<R>(r))` if this expression is well-formed.

(1.2) — Otherwise, if `R` models `sized_range`, fills `r` with `ranges::size(r)` values of type `invoke_result_t<G&>` by performing an unspecified number of invocations of the form `g()` or `g.generate_random(s)`, if such an expression is well-formed for a value `N` and an object `s` of type `span<invoke_result_t<G&>, N>`.

[*Note 1*: Values of `N` can differ between invocations. — *end note*]

(1.3) — Otherwise, calls `ranges::generate(std::forward<R>(r), ref(g))`.

2 *Returns*: `ranges::end(r)`.

3 *Remarks*: The effects of `generate_random(r, g)` shall be equivalent to `ranges::generate(std::forward<R>(r), ref(g))`.

[*Note 2*: This implies that `g.generate_random(a)` fills `a` with the same values as produced by invocation of `g()`. — *end note*]

```
template<class G, output_iterator<invoke_result_t<G&>> O, sentinel_for<O> S>
  requires uniform_random_bit_generator<remove_cvref_t<G>>
  constexpr O ranges::generate_random(O first, S last, G&& g);
```

4 *Effects*: Equivalent to:

```
return generate_random(subrange<O, S>(std::move(first), last), g);
```

```
template<class R, class G, class D>
  requires output_range<R, invoke_result_t<D&, G&>> && invocable<D&, G&> &&
           uniform_random_bit_generator<remove_cvref_t<G>> &&
           is_arithmetic_v<invoke_result_t<D&, G&>>
  constexpr borrowed_iterator_t<R> ranges::generate_random(R&& r, G&& g, D&& d);
```

5 *Effects*:

(5.1) — Calls `d.generate_random(std::forward<R>(r), g)` if this expression is well-formed.

(5.2) — Otherwise, if `R` models `sized_range`, fills `r` with `ranges::size(r)` values of type `invoke_result_t<D&, G&>` by performing an unspecified number of invocations of the form `invoke(d, g)` or `d.generate_random(s, g)`, if such an expression is well-formed for a value `N` and an object `s` of type `span<invoke_result_t<D&, G&>, N>`.

[*Note 3*: Values of N can differ between invocations. — *end note*]

(5.3) — Otherwise, calls

```
ranges::generate(std::forward<R>(r), [&d, &g] { return invoke(d, g); });
```

6 *Returns*: `ranges::end(r)`.

7 *Remarks*: The effects of `generate_random(r, g, d)` shall be equivalent to

```
ranges::generate(std::forward<R>(r), [&d, &g] { return invoke(d, g); })
```

[*Note 4*: This implies that `d.generate_random(a, g)` fills `a` with the values with the same random distribution as produced by invocation of `invoke(d, g)`. — *end note*]

```
template<class G, class D, output_iterator<invoke_result_t<D&, G&>> O, sentinel_for<O> S>
  requires invocable<D&, G&> && uniform_random_bit_generator<remove_cvref_t<G>> &&
           is_arithmetic_v<invoke_result_t<D&, G&>>
  constexpr O ranges::generate_random(O first, S last, G&& g, D&& d);
```

8 *Effects*: Equivalent to:

```
return generate_random(subrange<O, S>(std::move(first), last), g, d);
```

26.13 C library algorithms [alg.c.library]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
void* bsearch(const void* key, void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, void* base, size_t nmemb, size_t size,
              compare-pred* compar);
const void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
                    c-compare-pred* compar);
```

```
const void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
                    compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

2 *Preconditions*: For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Throws*: Any exception thrown by `compar` (16.4.6.14).

©ISO/IEC

27 Strings library [strings]

27.1 General [strings.general]

1 This Clause describes components for manipulating sequences of any non-array trivially copyable standard-layout (6.9.1) type `T` where `is_trivially_default_constructible_v<T>` is `true`. Such types are called *char-like types*, and objects of char-like types are called *char-like objects* or simply *characters*.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 86.

Table 86 — Strings library summary [tab:strings.summary]

	Subclause	Header
27.2	Character traits	`<string>`
27.3	String view classes	`<string_view>`
27.4	String classes	`<string>`
27.5	Null-terminated sequence utilities	`<cstring>`

27.2 Character traits [char.traits]

27.2.1 General [char.traits.general]

1 Subclause 27.2 defines requirements on classes representing *character traits*, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.

2 Most classes specified in 27.4, 27.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member *typedef-name*s and functions in the template parameter `traits` used by each such template. Subclause 27.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) `C`, that and its related character traits class `X` are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If `X::char_type` is not the same type as `C`, the program is ill-formed.

27.2.2 Character traits requirements [char.traits.require]

1 In Table 87, `X` denotes a traits class defining types and functions for the character container type `C`; `c` and `d` denote values of type `C`; `p` and `q` denote values of type `const C*`; `s` denotes a value of type `C*`; `n`, `i` and `j` denote values of type `size_t`; `e` and `f` denote values of type `X::int_type`; `pos` denotes a value of type `X::pos_type`; and `r` denotes an lvalue of type `C`. No expression which is part of the character traits requirements specified in 27.2.2 shall exit via an exception.

Table 87 — Character traits requirements [tab:char.traits.req]

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::char_type`	`C`		
`X::int_type`		(described in 27.2.3)	
`X::off_type`		(described in 31.2.3 and 31.3)	
`X::pos_type`		(described in 31.2.3 and 31.3)	
`X::state_type`		(described in 27.2.3)	
`X::eq(c,d)`	`bool`	*Returns*: whether `c` is to be treated as equal to `d`.	constant
`X::lt(c,d)`	`bool`	*Returns*: whether `c` is to be treated as less than `d`.	constant

Table 87 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::compare(p,q,n)`	`int`	*Returns*: `0` if for each `i` in $[0, n)$, `X::eq(p[i],q[i])` is `true`; else, a negative value if, for some `j` in $[0, n)$, `X::lt(p[j],q[j])` is `true` and for each `i` in $[0, j)$ `X::eq(p[i],q[i])` is `true`; else a positive value.	linear
`X::length(p)`	`size_t`	*Returns*: the smallest `i` such that `X::eq(p[i],charT())` is `true`.	linear
`X::find(p,n,c)`	`const X::char_type*`	*Returns*: the smallest `q` in $[p, p+n)$ such that `X::eq(*q,c)` is `true`, `nullptr` otherwise.	linear
`X::move(s,p,n)`	`X::char_type*`	for each `i` in $[0, n)$, performs `X::assign(s[i],p[i])`. Copies correctly even where the ranges $[p, p+n)$ and $[s, s+n)$ overlap. *Returns*: `s`.	linear
`X::copy(s,p,n)`	`X::char_type*`	*Preconditions*: The ranges $[p, p+n)$ and $[s, s+n)$ do not overlap. *Returns*: `s`. for each `i` in $[0, n)$, performs `X::assign(s[i],p[i])`.	linear
`X::assign(r,d)`	(not used)	assigns `r=d`.	constant
`X::assign(s,n,c)`	`X::char_type*`	for each `i` in $[0, n)$, performs `X::assign(s[i],c)`. *Returns*: `s`.	linear
`X::not_eof(e)`	`int_type`	*Returns*: `e` if `X::eq_int_type(e,X::eof())` is `false`, otherwise a value `f` such that `X::eq_int_type(f,X::eof())` is `false`.	constant
`X::to_char_type(e)`	`X::char_type`	*Returns*: if for some `c`, `X::eq_int_type(e,X::to_int_type(c))` is `true`, `c`; else some unspecified value.	constant
`X::to_int_type(c)`	`X::int_type`	*Returns*: some value `e`, constrained by the definitions of `to_char_type` and `eq_int_type`.	constant
`X::eq_int_type(e,f)`	`bool`	*Returns*: for all `c` and `d`, `X::eq(c,d)` is equal to `X::eq_int_type(X::to_int_type(c), X::to_int_type(d))`; otherwise, yields `true` if `e` and `f` are both copies of `X::eof()`; otherwise, yields `false` if one of `e` and `f` is a copy of `X::eof()` and the other is not; otherwise the value is unspecified.	constant

©ISO/IEC

Table 87 — Character traits requirements (continued)

Expression	Return type	Assertion/note pre-/post-condition	Complexity
`X::eof()`	`X::int_type`	*Returns*: a value `e` such that `X::eq_int_type(e,X::to_int_type(c))` is `false` for all values `c`.	constant

2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header `<string>` (27.4.2) as a basis for explicit specializations.

27.2.3 Traits typedefs [char.traits.typedefs]

```
using int_type = see below;
```

1 *Preconditions*: `int_type` shall be able to represent all of the valid characters converted from the corresponding `char_type` values, as well as an end-of-file value, `eof()`.[190]

```
using state_type = see below;
```

2 *Preconditions*: `state_type` meets the *Cpp17Destructible* (Table 35), *Cpp17CopyAssignable* (Table 34), *Cpp17CopyConstructible* (Table 32), and *Cpp17DefaultConstructible* (Table 30) requirements.

27.2.4 `char_traits` specializations [char.traits.specializations]

27.2.4.1 General [char.traits.specializations.general]

```
namespace std {
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;
}
```

1 The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

27.2.4.2 `struct char_traits<char>` [char.traits.specializations.char]

```
namespace std {
  template<> struct char_traits<char> {
    using char_type  = char;
    using int_type   = int;
    using off_type   = streamoff;
    using pos_type   = streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
```

190) If `eof()` can be held in `char_type` then some iostreams operations can give surprising results.

```
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The type `mbstate_t` is defined in `<cwchar>` (28.7.3) and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.

3 The member `eof()` returns `EOF`.

27.2.4.3 `struct char_traits<char8_t>` [char.traits.specializations.char8.t]

```
namespace std {
  template<> struct char_traits<char8_t> {
    using char_type  = char8_t;
    using int_type   = unsigned int;
    using off_type   = streamoff;
    using pos_type   = u8streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

27.2.4.4 `struct char_traits<char16_t>` [char.traits.specializations.char16.t]

```
namespace std {
  template<> struct char_traits<char16_t> {
    using char_type  = char16_t;
    using int_type   = uint_least16_t;
    using off_type   = streamoff;
    using pos_type   = u16streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;
```

```
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

27.2.4.5 `struct char_traits<char32_t>` [char.traits.specializations.char32.t]

```
namespace std {
  template<> struct char_traits<char32_t> {
    using char_type  = char32_t;
    using int_type   = uint_least32_t;
    using off_type   = streamoff;
    using pos_type   = u32streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns an implementation-defined constant that cannot appear as a Unicode code point.

27.2.4.6 `struct char_traits<wchar_t>` [char.traits.specializations.wchar.t]

```
namespace std {
  template<> struct char_traits<wchar_t> {
    using char_type  = wchar_t;
    using int_type   = wint_t;
    using off_type   = streamoff;
    using pos_type   = wstreampos;
    using state_type = mbstate_t;
```

```
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;

    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n,
                                           const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

1 The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

2 The member `eof()` returns `WEOF`.

27.3 String view classes [string.view]

27.3.1 General [string.view.general]

1 The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (27.1) objects with the first element of the sequence at position zero. In the rest of 27.3, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

2 [*Note 1*: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view<charT>` in order to interoperate with these functions. — *end note*]

27.3.2 Header <string_view> synopsis [string.view.synop]

```
// mostly freestanding
#include <compare>              // see 17.12.1

namespace std {
  // 27.3.3, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;                                    // partially freestanding

  template<class charT, class traits>
    constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
  template<class charT, class traits>
    constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

  // 27.3.4, non-member comparison functions
  template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> x,
                              type_identity_t<basic_string_view<charT, traits>> y) noexcept;
  template<class charT, class traits>
    constexpr see below operator<=>(basic_string_view<charT, traits> x,
                                    type_identity_t<basic_string_view<charT,
                                                    traits>> y) noexcept;
```

```
  // 27.3.5, inserters and extractors
  template<class charT, class traits>
    basic_ostream<charT, traits>&
      operator<<(basic_ostream<charT, traits>& os,
                 basic_string_view<charT, traits> str);                    // hosted

  // basic_string_view typedef-names
  using string_view    = basic_string_view<char>;
  using u8string_view  = basic_string_view<char8_t>;
  using u16string_view = basic_string_view<char16_t>;
  using u32string_view = basic_string_view<char32_t>;
  using wstring_view   = basic_string_view<wchar_t>;

  // 27.3.6, hash support
  template<class T> struct hash;
  template<> struct hash<string_view>;
  template<> struct hash<u8string_view>;
  template<> struct hash<u16string_view>;
  template<> struct hash<u32string_view>;
  template<> struct hash<wstring_view>;

  inline namespace literals {
    inline namespace string_view_literals {
      // 27.3.7, suffix for basic_string_view literals
      constexpr string_view    operator""sv(const char* str, size_t len) noexcept;
      constexpr u8string_view  operator""sv(const char8_t* str, size_t len) noexcept;
      constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
      constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
      constexpr wstring_view   operator""sv(const wchar_t* str, size_t len) noexcept;
    }
  }
}
```

1 The function templates defined in 22.2.2 and 24.7 are available when `<string_view>` is included.

27.3.3 Class template `basic_string_view` [string.view.template]

27.3.3.1 General [string.view.template.general]

```
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view {
  public:
    // types
    using traits_type            = traits;
    using value_type             = charT;
    using pointer                = value_type*;
    using const_pointer          = const value_type*;
    using reference              = value_type&;
    using const_reference        = const value_type&;
    using const_iterator         = implementation-defined; // see 27.3.3.4
    using iterator               = const_iterator;[191]
    using const_reverse_iterator = reverse_iterator<const_iterator>;
    using reverse_iterator       = const_reverse_iterator;
    using size_type              = size_t;
    using difference_type        = ptrdiff_t;
    static constexpr size_type npos = size_type(-1);

    // 27.3.3.2, construction and assignment
    constexpr basic_string_view() noexcept;
    constexpr basic_string_view(const basic_string_view&) noexcept = default;
    constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
    constexpr basic_string_view(const charT* str);
    basic_string_view(nullptr_t) = delete;
```

191) Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

```
constexpr basic_string_view(const charT* str, size_type len);
template<class It, class End>
  constexpr basic_string_view(It begin, End end);
template<class R>
  constexpr explicit basic_string_view(R&& r);

// 27.3.3.4, iterator support
constexpr const_iterator begin() const noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// 27.3.3.5, capacity
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
constexpr size_type max_size() const noexcept;

    constexpr size_type find_first_not_of(const charT* s, size_type pos = 0) const;
    constexpr size_type find_last_not_of(basic_string_view s,
                                         size_type pos = npos) const noexcept;
    constexpr size_type find_last_not_of(charT c, size_type pos = npos) const noexcept;
    constexpr size_type find_last_not_of(const charT* s, size_type pos,
                                         size_type n) const;
    constexpr size_type find_last_not_of(const charT* s, size_type pos = npos) const;

  private:
    const charT* data_;         // exposition only
    size_type size_;            // exposition only
  };

  // 27.3.3.3, deduction guides
  template<class It, class End>
    basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
  template<class R>
    basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
}
```

1 In every specialization `basic_string_view<charT, traits>`, the type `traits` shall meet the character traits requirements (27.2).

[*Note 1*: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — *end note*]

2 For a `basic_string_view str`, any operation that invalidates a pointer in the range

[`str.data()`, `str.data() + str.size()`)

invalidates pointers, iterators, and references to elements of `str`.

3 The complexity of `basic_string_view` member functions is $\mathcal{O}(1)$ unless otherwise specified.

4 `basic_string_view<charT, traits>` is a trivially copyable type (6.9.1).

27.3.3.2 Construction and assignment [string.view.cons]

```
constexpr basic_string_view() noexcept;
```

1 *Postconditions*: `data_ == nullptr` and `size_ == 0`.

```
constexpr basic_string_view(const charT* str);
```

2 *Preconditions*: [`str`, `str + traits::length(str)`) is a valid range.

3 *Effects*: Constructs a `basic_string_view`, initializing `data_` with `str` and initializing `size_` with `traits::length(str)`.

4 *Complexity*: *O*(`traits::length(str)`).

```
constexpr basic_string_view(const charT* str, size_type len);
```

5 *Preconditions*: [`str`, `str + len`) is a valid range.

6 *Effects*: Constructs a `basic_string_view`, initializing *`data_`* with `str` and initializing *`size_`* with `len`.

```
template<class It, class End>
  constexpr basic_string_view(It begin, End end);
```

7 *Constraints*:

(7.1) — `It` satisfies `contiguous_iterator`.

(7.2) — `End` satisfies `sized_sentinel_for<It>`.

(7.3) — `is_same_v<iter_value_t<It>, charT>` is `true`.

(7.4) — `is_convertible_v<End, size_type>` is `false`.

8 *Preconditions*:

(8.1) — [`begin`, `end`) is a valid range.

(8.2) — `It` models `contiguous_iterator`.

(8.3) — `End` models `sized_sentinel_for<It>`.

9 *Effects*: Initializes *`data_`* with `to_address(begin)` and initializes *`size_`* with `end - begin`.

10 *Throws*: When and what `end - begin` throws.

```
template<class R>
  constexpr explicit basic_string_view(R&& r);
```

11 Let `d` be an lvalue of type `remove_cvref_t<R>`.

12 *Constraints*:

(12.1) — `remove_cvref_t<R>` is not the same type as `basic_string_view`,

(12.2) — `R` models `ranges::contiguous_range` and `ranges::sized_range`,

(12.3) — `is_same_v<ranges::range_value_t<R>, charT>` is `true`,

(12.4) — `is_convertible_v<R, const charT*>` is `false`, and

(12.5) — `d.operator ::std::basic_string_view<charT, traits>()` is not a valid expression.

13 *Effects*: Initializes *`data_`* with `ranges::data(r)` and *`size_`* with `ranges::size(r)`.

14 *Throws*: Any exception thrown by `ranges::data(r)` and `ranges::size(r)`.

27.3.3.3 Deduction guides [string.view.deduct]

```
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

1 *Constraints*:

(1.1) — `It` satisfies `contiguous_iterator`.

(1.2) — `End` satisfies `sized_sentinel_for<It>`.

```
template<class R>
  basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
```

2 *Constraints*: `R` satisfies `ranges::contiguous_range`.

27.3.3.4 Iterator support [string.view.iterators]

```
using const_iterator = implementation-defined;
```

1 A type that meets the requirements of a constant *Cpp17RandomAccessIterator* (24.3.5.7), models `contiguous_iterator` (24.3.4.14), and meets the constexpr iterator requirements (24.3.1), whose `value_type` is the template parameter `charT`.

2 All requirements on container iterators (23.2) apply to `basic_string_view::const_iterator` as well.

```
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

3 *Returns*: An iterator such that

(3.1) — if `!empty()`, `addressof(*begin()) == data_`,

(3.2) — otherwise, an unspecified value such that [`begin()`, `end()`) is a valid range.

```
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

4 *Returns*: `begin() + size()`.

```
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

5 *Returns*: `const_reverse_iterator(end())`.

```
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

6 *Returns*: `const_reverse_iterator(begin())`.

27.3.3.5 Capacity [string.view.capacity]

```
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

1 *Returns*: *size_*.

```
constexpr size_type max_size() const noexcept;
```

2 *Returns*: The largest possible number of char-like objects that can be referred to by a `basic_string_view`.

```
constexpr bool empty() const noexcept;
```

3 *Returns*: *size_* `== 0`.

27.3.3.6 Element access [string.view.access]

```
constexpr const_reference operator[](size_type pos) const;
```

1 *Hardened preconditions*: `pos < size()` is `true`.

[*Note 1*: This precondition is stronger than the one on `basic_string::operator[]`. — *end note*]

2 *Returns*: *data_*`[pos]`.

3 *Throws*: Nothing.

```
constexpr const_reference at(size_type pos) const;
```

4 *Returns*: *data_*`[pos]`.

5 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const_reference front() const;
```

6 *Hardened preconditions*: `empty()` is `false`.

7 *Returns*: *data_*`[0]`.

8 *Throws*: Nothing.

```
constexpr const_reference back() const;
```

9 *Hardened preconditions*: `empty()` is `false`.

10 *Returns*: *data_*`[size() - 1]`.

11 *Throws*: Nothing.

```
constexpr const charT* data() const noexcept;
```

12 *Returns*: *data_*.

13 [*Note 2*: Unlike `basic_string::data()` and *string-literal*s, `data()` can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass `data()` to a function that takes just a `const charT*` and expects a null-terminated string. — *end note*]

27.3.3.7 Modifiers [string.view.modifiers]

```
constexpr void remove_prefix(size_type n);
```

1 *Hardened preconditions*: `n <= size()` is `true`.

2 *Effects*: Equivalent to: `data_ += n; size_ -= n;`

```
constexpr void remove_suffix(size_type n);
```

3 *Hardened preconditions*: `n <= size()` is `true`.

4 *Effects*: Equivalent to: `size_ -= n;`

```
constexpr void swap(basic_string_view& s) noexcept;
```

5 *Effects*: Exchanges the values of `*this` and `s`.

27.3.3.8 String operations [string.view.ops]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 Let `rlen` be the smaller of `n` and `size() - pos`.

2 *Preconditions*: [`s`, `s + rlen`) is a valid range.

3 *Effects*: Equivalent to `traits::copy(s, data() + pos, rlen)`.

4 *Returns*: `rlen`.

5 *Throws*: `out_of_range` if `pos > size()`.

6 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
constexpr basic_string_view subview(size_type pos = 0, size_type n = npos) const;
```

7 Let `rlen` be the smaller of `n` and `size() - pos`.

8 *Effects*: Determines `rlen`, the effective length of the string to reference.

9 *Returns*: `basic_string_view(data() + pos, rlen)`.

10 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr int compare(basic_string_view str) const noexcept;
```

11 Let `rlen` be the smaller of `size()` and `str.size()`.

12 *Effects*: Determines `rlen`, the effective length of the strings to compare. The function then compares the two strings by calling `traits::compare(data(), str.data(), rlen)`.

13 *Returns*: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 88.

Table 88 — `compare()` results [tab:string.view.compare]

Condition	Return Value
`size() < str.size()`	`< 0`
`size() == str.size()`	`0`
`size() > str.size()`	`> 0`

14 *Complexity*: $\mathcal{O}$(`rlen`).

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str);`

```
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
                      size_type pos2, size_type n2) const;
```

16 *Effects*: Equivalent to: `return substr(pos1, n1).compare(str.substr(pos2, n2));`

```
constexpr int compare(const charT* s) const;
```

17 *Effects*: Equivalent to: `return compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s));`

```
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19 *Effects*: Equivalent to: `return substr(pos1, n1).compare(basic_string_view(s, n2));`

```
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20 Let `rlen` be the smaller of `size()` and `x.size()`.

21 *Effects*: Equivalent to: `return basic_string_view(data(), rlen) == x;`

```
constexpr bool starts_with(charT x) const noexcept;
```

22 *Effects*: Equivalent to: `return !empty() && traits::eq(front(), x);`

```
constexpr bool starts_with(const charT* x) const;
```

23 *Effects*: Equivalent to: `return starts_with(basic_string_view(x));`

```
constexpr bool ends_with(basic_string_view x) const noexcept;
```

24 Let `rlen` be the smaller of `size()` and `x.size()`.

25 *Effects*: Equivalent to:

```
return basic_string_view(data() + (size() - rlen), rlen) == x;
```

```
constexpr bool ends_with(charT x) const noexcept;
```

26 *Effects*: Equivalent to: `return !empty() && traits::eq(back(), x);`

```
constexpr bool ends_with(const charT* x) const;
```

27 *Effects*: Equivalent to: `return ends_with(basic_string_view(x));`

```
constexpr bool contains(basic_string_view x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

28 *Effects*: Equivalent to: `return find(x) != npos;`

27.3.3.9 Searching [string.view.find]

1 Member functions in this subclause have complexity $\mathcal{O}$(`size() * str.size()`) at worst, although implementations should do better.

2 Let F be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(2.1) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view(s), pos);`

(2.2) — Each member function of the form

```
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view(s, n), pos);`

(2.3) — Each member function of the form

```
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view(addressof(c), 1), pos);`

```
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

3 Let xpos be the lowest position, if possible, such that the following conditions hold:

(3.1) — pos <= xpos

(3.2) — xpos + str.size() <= size()

(3.3) — traits::eq(*data*_[xpos + I], str[I]) for all elements I of the string referenced by str.

4 *Effects*: Determines xpos.

5 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;
```

6 Let xpos be the highest position, if possible, such that the following conditions hold:

(6.1) — xpos <= pos

(6.2) — xpos + str.size() <= size()

(6.3) — traits::eq(*data*_[xpos + I], str[I]) for all elements I of the string referenced by str.

7 *Effects*: Determines xpos.

8 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;
```

9 Let xpos be the lowest position, if possible, such that the following conditions hold:

(9.1) — pos <= xpos

(9.2) — xpos < size()

(9.3) — traits::eq(*data*_[xpos], str[I]) for some element I of the string referenced by str.

10 *Effects*: Determines xpos.

11 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

12 Let xpos be the highest position, if possible, such that the following conditions hold:

(12.1) — xpos <= pos

(12.2) — xpos < size()

(12.3) — traits::eq(*data*_[xpos], str[I]) for some element I of the string referenced by str.

13 *Effects*: Determines xpos.

14 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

15 Let xpos be the lowest position, if possible, such that the following conditions hold:

(15.1) — pos <= xpos

(15.2) — xpos < size()

(15.3) — traits::eq(*data*_[xpos], str[I]) for no element I of the string referenced by str.

16 *Effects*: Determines xpos.

17 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

18 Let xpos be the highest position, if possible, such that the following conditions hold:

(18.1) — xpos <= pos

(18.2) — xpos < size()

(18.3) — traits::eq(*data*_[xpos], str[I]) for no element I of the string referenced by str.

19 *Effects*: Determines xpos.

20 *Returns*: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

27.3.4 Non-member comparison functions [string.view.comparison]

```
template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> lhs,
                            type_identity_t<basic_string_view<charT, traits>> rhs) noexcept;
```

1 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class charT, class traits>
  constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
                                  type_identity_t<basic_string_view<charT, traits>> rhs) noexcept;
```

2 Let `R` denote the type `traits::comparison_category` if that *qualified-id* is valid and denotes a type (13.10.3), otherwise `R` is `weak_ordering`.

3 *Mandates*: `R` denotes a comparison category type (17.12.2).

4 *Returns*: `static_cast<R>(lhs.compare(rhs) <=> 0)`.

5 [*Note 1*: The usage of `type_identity_t` as parameter ensures that an object of type `basic_string_view<charT, traits>` can always be compared with an object of a type `T` with an implicit conversion to `basic_string_view<charT, traits>`, and vice versa, as per 12.2.2.3. — *end note*]

27.3.5 Inserters and extractors [string.view.io]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
```

1 *Effects*: Behaves as a formatted output function (31.7.6.3.1) of `os`. Forms a character sequence `seq`, initially consisting of the elements defined by the range [`str.begin()`, `str.end()`). Determines padding for `seq` as described in 31.7.6.3.1. Then inserts `seq` as if by calling `os.rdbuf()->sputn(seq, n)`, where `n` is the larger of `os.width()` and `str.size()`; then calls `os.width(0)`.

2 *Returns*: `os`.

27.3.6 Hash support [string.view.hash]

```
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

1 The specialization is enabled (22.10.19).

[*Note 1*: The hash value of a string view object is equal to the hash value of the corresponding string object (27.4.6). — *end note*]

27.3.7 Suffix for `basic_string_view` literals [string.view.literals]

```
constexpr string_view operator""sv(const char* str, size_t len) noexcept;
```

1 *Returns*: `string_view{str, len}`.

```
constexpr u8string_view operator""sv(const char8_t* str, size_t len) noexcept;
```

2 *Returns*: `u8string_view{str, len}`.

```
constexpr u16string_view operator""sv(const char16_t* str, size_t len) noexcept;
```

3 *Returns*: `u16string_view{str, len}`.

```
constexpr u32string_view operator""sv(const char32_t* str, size_t len) noexcept;
```

4 *Returns*: `u32string_view{str, len}`.

```
constexpr wstring_view operator""sv(const wchar_t* str, size_t len) noexcept;
```

5 *Returns*: `wstring_view{str, len}`.

27.4 String classes [string.classes]

27.4.1 General [string.classes.general]

1 The header <string> defines the basic_string class template for manipulating varying-length sequences of char-like objects and five *typedef-name*s, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

27.4.2 Header <string> synopsis [string.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 27.2, character traits
  template<class charT> struct char_traits;                                  // freestanding
  template<> struct char_traits<char>;                                       // freestanding
  template<> struct char_traits<char8_t>;                                    // freestanding
  template<> struct char_traits<char16_t>;                                   // freestanding
  template<> struct char_traits<char32_t>;                                   // freestanding
  template<> struct char_traits<wchar_t>;                                    // freestanding

  // 27.4.3, basic_string
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_string;

  template<class charT, class traits, class Allocator>
    constexpr basic_string<charT, traits, Allocator>
      operator+(const basic_string<charT, traits, Allocator>& lhs,
                const basic_string<charT, traits, Allocator>& rhs);

27.4.3 Class template `basic_string` [basic.string]

27.4.3.1 General [basic.string.general]

1 The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a "string" if the type of the char-like objects that it holds is clear from context. In the rest of 27.4.3, the type of the char-like objects held in a `basic_string` object is designated by `charT`.

2 A specialization of `basic_string` is a contiguous container (23.2.2.2).

3 In all cases, [`data()`,`data() + size()`] is a valid range, `data() + size()` points at an object with value `charT()` (a "null terminator"), and `size() <= capacity()` is `true`. The program has undefined behavior if the null terminator is modified to any value other than `charT()`.

```
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_string {
  public:
    // types
    using traits_type            = traits;
    using value_type             = charT;
    using allocator_type         = Allocator;
    using size_type              = allocator_traits<Allocator>::size_type;
    using difference_type        = allocator_traits<Allocator>::difference_type;
    using pointer                = allocator_traits<Allocator>::pointer;

    -> basic_string<charT, traits, Allocator>;
}
```

4 A `size_type` parameter type in a `basic_string` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

5 The types `iterator` and `const_iterator` meet the constexpr iterator requirements (24.3.1).

27.4.3.2 General requirements [string.require]

1 If any operation would cause `size()` to exceed `max_size()`, that operation throws an exception object of type `length_error`.

2 If any member function or operator of `basic_string` throws an exception, that function or operator has no other effect on the `basic_string` object.

3 Every object of type `basic_string<charT, traits, Allocator>` uses an object of type `Allocator` to allocate and free storage for the contained `charT` objects as needed. The `Allocator` object used is obtained as described in 23.2.2.2. In every specialization `basic_string<charT, traits, Allocator>`, the type `traits` shall meet the character traits requirements (27.2).

[*Note 1*: Every specialization `basic_string<charT, traits, Allocator>` is an allocator-aware container (23.2.2.5), but does not use the allocator's `construct` and `destroy` member functions (23.2.1). The program is ill-formed if `Allocator::value_type` is not the same type as `charT`. — *end note*]

[*Note 2*: The program is ill-formed if `traits::char_type` is not the same type as `charT`. — *end note*]

4 References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:

(4.1) — Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.[192]

(4.2) — Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

27.4.3.3 Constructors and assignment operators [string.cons]

```
constexpr explicit basic_string(const Allocator& a) noexcept;
```

1 *Postconditions*: `size()` is equal to `0`.

```
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

2 *Effects*: Constructs an object whose value is that of `str` prior to this call.

3 *Remarks*: In the second form, `str` is left in a valid but unspecified state.

```
constexpr basic_string(const basic_string& str, size_type pos,
                       const Allocator& a = Allocator());
constexpr basic_string(const basic_string& str, size_type pos, size_type n,
                       const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos,
                       const Allocator& a = Allocator());
constexpr basic_string(basic_string&& str, size_type pos, size_type n,
                       const Allocator& a = Allocator());
```

4 Let

(4.1) — `s` be the value of `str` prior to this call and

(4.2) — `rlen` be `pos + min(n, s.size() - pos)` for the overloads with parameter `n`, and `s.size()` otherwise.

5 *Effects*: Constructs an object whose initial value is the range [`s.data() + pos`, `s.data() + rlen`).

6 *Throws*: `out_of_range` if `pos > s.size()`.

7 *Remarks*: For the overloads with a `basic_string&&` parameter, `str` is left in a valid but unspecified state.

8 *Recommended practice*: For the overloads with a `basic_string&&` parameter, implementations should avoid allocation if `s.get_allocator() == a` is `true`.

```
template<class T>
  constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

9 *Constraints*: `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true`.

10 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as:

```
basic_string(sv.substr(pos, n), a);
```

```
template<class T>
  constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

11 *Constraints*:

(11.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(11.2) — `is_convertible_v<const T&, const charT*>` is `false`.

12 *Effects*: Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a)`.

192) For example, as an argument to non-member functions `swap()` (27.4.4.3), `operator>>()` (27.4.4.4), and `getline()` (27.4.4.4), or as an argument to `basic_string::swap()`.

```
constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
```

13 *Preconditions*: [s, s + n) is a valid range.

14 *Effects*: Constructs an object whose initial value is the range [s, s + n).

15 *Postconditions*: size() is equal to n, and traits::compare(data(), s, n) is equal to 0.

```
constexpr basic_string(const charT* s, const Allocator& a = Allocator());
```

16 *Constraints*: Allocator is a type that qualifies as an allocator (23.2.2.2).

[*Note 1*: This affects class template argument deduction. — *end note*]

17 *Effects*: Equivalent to: basic_string(s, traits::length(s), a).

```
constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());
```

18 *Constraints*: Allocator is a type that qualifies as an allocator (23.2.2.2).

[*Note 2*: This affects class template argument deduction. — *end note*]

19 *Effects*: Constructs an object whose value consists of n copies of c.

```
template<class InputIterator>
  constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());
```

20 *Constraints*: InputIterator is a type that qualifies as an input iterator (23.2.2.2).

21 *Effects*: Constructs a string from the values in the range [begin, end), as specified in 23.2.4.

```
template<container-compatible-range<charT> R>
  constexpr basic_string(from_range_t, R&& rg, const Allocator& = Allocator());
```

22 *Effects*: Constructs a string from the values in the range rg, as specified in 23.2.4.

```
constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());
```

23 *Effects*: Equivalent to basic_string(il.begin(), il.end(), a).

```
constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);
```

24 *Effects*: Constructs an object whose value is that of str prior to this call. The stored allocator is constructed from alloc. In the second form, str is left in a valid but unspecified state.

25 *Throws*: The second form throws nothing if alloc == str.get_allocator().

```
template<class InputIterator,
         class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
  basic_string(InputIterator, InputIterator, Allocator = Allocator())
    -> basic_string<typename iterator_traits<InputIterator>::value_type,
                    char_traits<typename iterator_traits<InputIterator>::value_type>,
                    Allocator>;
```

26 *Constraints*: InputIterator is a type that qualifies as an input iterator, and Allocator is a type that qualifies as an allocator (23.2.2.2).

```
template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
  basic_string(basic_string_view<charT, traits>,
               typename see below::size_type, typename see below::size_type,
               const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;
```

27 *Constraints*: Allocator is a type that qualifies as an allocator (23.2.2.2).

```
constexpr basic_string& operator=(const basic_string& str);
```

28 *Effects*: If `*this` and `str` are the same object, has no effect. Otherwise, replaces the value of `*this` with a copy of `str`.

29 *Returns*: `*this`.

```
constexpr basic_string& operator=(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

30 *Effects*: Move assigns as a sequence container (23.2.4), except that iterators, pointers and references may be invalidated.

31 *Returns*: `*this`.

```
template<class T>
  constexpr basic_string& operator=(const T& t);
```

32 *Constraints*:

(32.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(32.2) — `is_convertible_v<const T&, const charT*>` is `false`.

33 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv);
```

```
constexpr basic_string& operator=(const charT* s);
```

34 *Effects*: Equivalent to: `return *this = basic_string_view<charT, traits>(s);`

```
constexpr basic_string& operator=(charT c);
```

35 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(addressof(c), 1);
```

```
constexpr basic_string& operator=(initializer_list<charT> il);
```

36 *Effects*: Equivalent to:

```
return *this = basic_string_view<charT, traits>(il.data(), il.size());
```

27.4.3.4 Iterator support [string.iterators]

```
constexpr iterator       begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;
```

1 *Returns*: An iterator referring to the first character in the string.

```
constexpr iterator       end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;
```

2 *Returns*: An iterator which is the past-the-end value.

```
constexpr reverse_iterator       rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
```

3 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(end())`.

```
constexpr reverse_iterator       rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;
```

4 *Returns*: An iterator which is semantically equivalent to `reverse_iterator(begin())`.

27.4.3.5 Capacity [string.capacity]

```
constexpr size_type size() const noexcept;
```

```
constexpr size_type length() const noexcept;
```

1 *Returns*: A count of the number of char-like objects currently in the string.

2 *Complexity*: Constant time.

```
constexpr size_type max_size() const noexcept;
```

3 *Returns*: The largest possible number of char-like objects that can be stored in a `basic_string`.

4 *Complexity*: Constant time.

```
constexpr void resize(size_type n, charT c);
```

5 *Effects*: Alters the value of `*this` as follows:

(5.1) — If `n <= size()`, erases the last `size() - n` elements.

(5.2) — If `n > size()`, appends `n - size()` copies of `c`.

```
constexpr void resize(size_type n);
```

6 *Effects*: Equivalent to `resize(n, charT())`.

```
template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);
```

7 Let

(7.1) — `o = size()` before the call to `resize_and_overwrite`.

(7.2) — `k` be `min(o, n)`.

(7.3) — `p` be a value of type `charT*` or `charT* const`, such that the range $[$`p`, `p + n`$]$ is valid and `this->compare(0, k, p, k) == 0` is `true` before the call. The values in the range $[$`p + k`, `p + n`$]$ may be indeterminate (6.8.5).

(7.4) — `m` be a value of type `size_type` or `const size_type` equal to `n`.

(7.5) — *`OP`* be the expression `std::move(op)(p, m)`.

(7.6) — `r` = *`OP`*.

8 *Mandates*: *`OP`* has an integer-like type (24.3.4.4).

9 *Preconditions*:

(9.1) — *`OP`* does not throw an exception or modify `p` or `m`.

(9.2) — `r` $\geq$ 0.

(9.3) — `r` $\leq$ `m`.

(9.4) — After evaluating *`OP`* there are no indeterminate values in the range $[$`p`, `p + r`$)$.

10 *Effects*: Evaluates *`OP`*, replaces the contents of `*this` with $[$`p`, `p + r`$)$, and invalidates all pointers and references to the range $[$`p`, `p + n`$]$.

11 *Recommended practice*: Implementations should avoid unnecessary copies and allocations by, for example, making `p` a pointer into internal storage and by restoring `*(p + r)` to `charT()` after evaluating *`OP`*.

```
constexpr size_type capacity() const noexcept;
```

12 *Returns*: The size of the allocated storage in the string.

13 *Complexity*: Constant time.

```
constexpr void reserve(size_type res_arg);
```

14 *Effects*: A directive that informs a `basic_string` of a planned change in size, so that the storage allocation can be managed accordingly. Following a call to `reserve`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve`.

15 *Throws*: `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits <Allocator>::allocate`.

```
constexpr void shrink_to_fit();
```

16 *Effects*: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[*Note 1*: The request is non-binding to allow latitude for implementation-specific optimizations. — *end note*]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

17 *Complexity*: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

18 *Remarks*: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[*Note 2*: If no reallocation happens, they remain valid. — *end note*]

```
constexpr void clear() noexcept;
```

19 *Effects*: Equivalent to: `erase(begin(), end());`

```
constexpr bool empty() const noexcept;
```

20 *Effects*: Equivalent to: `return size() == 0;`

27.4.3.6 Element access [string.access]

```
constexpr const_reference operator[](size_type pos) const;
constexpr reference       operator[](size_type pos);
```

1 *Hardened preconditions*: `pos <= size()` is `true`.

2 *Returns*: `data()[pos]`.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

```
constexpr const_reference at(size_type pos) const;
constexpr reference       at(size_type pos);
```

5 *Returns*: `operator[](pos)`.

6 *Throws*: `out_of_range` if `pos >= size()`.

```
constexpr const_reference front() const;
constexpr reference front();
```

7 *Hardened preconditions*: `empty()` is `false`.

8 *Effects*: Equivalent to: `return operator[](0);`

```
constexpr const_reference back() const;
constexpr reference back();
```

9 *Hardened preconditions*: `empty()` is `false`.

10 *Effects*: Equivalent to: `return operator[](size() - 1);`

27.4.3.7 Modifiers [string.modifiers]

27.4.3.7.1 `basic_string::operator+=` [string.op.append]

```
constexpr basic_string& operator+=(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str);`

```
template<class T>
  constexpr basic_string& operator+=(const T& t);
```

2 *Constraints*:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(2.2) — `is_convertible_v<const T&, const charT*>` is `false`.

3 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv);
```

```
constexpr basic_string& operator+=(const charT* s);
```

4 *Effects*: Equivalent to: `return append(s);`

```
constexpr basic_string& operator+=(charT c);
```

5 *Effects*: Equivalent to: `return append(size_type{1}, c);`

```
constexpr basic_string& operator+=(initializer_list<charT> il);
```

6 *Effects*: Equivalent to: `return append(il);`

27.4.3.7.2 `basic_string::append` [string.append]

```
constexpr basic_string& append(const basic_string& str);
```

1 *Effects*: Equivalent to: `return append(str.data(), str.size());`

```
constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return append(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& append(const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));
```

```
constexpr basic_string& append(const charT* s, size_type n);
```

7 *Preconditions*: $[$`s`, `s + n`$)$ is a valid range.

8 *Effects*: Appends a copy of the range $[$`s`, `s + n`$)$ to the string.

9 *Returns*: `*this`.

```
constexpr basic_string& append(const charT* s);
```

10 *Effects*: Equivalent to: `return append(s, traits::length(s));`

```
constexpr basic_string& append(const charT* s, size_type pos, size_type n);
```

11 *Effects*: Equivalent to: `return append(basic_string_view<charT, traits>(s).substr(pos, n));`

```
constexpr basic_string& append(size_type n, charT c);
```

12 *Effects*: Appends `n` copies of `c` to the string.

13 *Returns*: `*this`.

```
template<class InputIterator>
  constexpr basic_string& append(InputIterator first, InputIterator last);
```

14 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

15 *Effects*: Equivalent to: `return append(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& append_range(R&& rg);
```

16 *Effects*: Equivalent to: `return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));`

```
constexpr basic_string& append(initializer_list<charT> il);
```

17 *Effects*: Equivalent to: `return append(il.data(), il.size());`

```
constexpr void push_back(charT c);
```

18 *Effects*: Equivalent to `append(size_type{1}, c)`.

27.4.3.7.3 `basic_string::assign` [string.assign]

```
constexpr basic_string& assign(const basic_string& str);
```

1 *Effects*: Equivalent to: `return *this = str;`

```
constexpr basic_string& assign(basic_string&& str)
  noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

2 *Effects*: Equivalent to: `return *this = std::move(str);`

```
constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
```

3 *Effects*: Equivalent to:

```
return assign(basic_string_view<charT, traits>(str).substr(pos, n));
```

```
template<class T>
  constexpr basic_string& assign(const T& t);
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return assign(sv.substr(pos, n));
```

```
constexpr basic_string& assign(const charT* s, size_type n);
```

8 *Preconditions*: [`s`, `s + n`) is a valid range.

9 *Effects*: Replaces the string controlled by `*this` with a copy of the range [`s`, `s + n`).

10 *Returns*: `*this`.

```
constexpr basic_string& assign(const charT* s);
```

11 *Effects*: Equivalent to: `return assign(s, traits::length(s));`

```
constexpr basic_string& assign(const charT* s, size_type pos, size_type n);
```

12 *Effects*: Equivalent to: `return assign(basic_string_view<charT, traits>(s).substr(pos, n));`

```
constexpr basic_string& assign(initializer_list<charT> il);
```

13 *Effects*: Equivalent to: `return assign(il.data(), il.size());`

```
constexpr basic_string& assign(size_type n, charT c);
```

14 *Effects*: Equivalent to:

```
clear();
resize(n, c);
return *this;
```

```
template<class InputIterator>
  constexpr basic_string& assign(InputIterator first, InputIterator last);
```

15 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

16 *Effects*: Equivalent to: `return assign(basic_string(first, last, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& assign_range(R&& rg);
```

17 *Effects*: Equivalent to: `return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));`

27.4.3.7.4 `basic_string::insert` [string.insert]

```
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

1 *Effects*: Equivalent to: `return insert(pos, str.data(), str.size());`

```
constexpr basic_string& insert(size_type pos1, const basic_string& str,
                               size_type pos2, size_type n = npos);
```

2 *Effects*: Equivalent to:

```
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

```
template<class T>
  constexpr basic_string& insert(size_type pos, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& insert(size_type pos1, const T& t,
                                 size_type pos2, size_type n = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));
```

```
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

7 *Preconditions*: $[$`s`, `s + n`$)$ is a valid range.

8 *Effects*: Inserts a copy of the range $[$`s`, `s + n`$)$ immediately before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos > size()`,

(10.2) — `length_error` if `n > max_size() - size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& insert(size_type pos, const charT* s);
```

11 *Effects*: Equivalent to: `return insert(pos, s, traits::length(s));`

```
constexpr basic_string& insert(size_type pos, size_type n, charT c);
```

12 *Effects*: Inserts `n` copies of `c` before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

13 *Returns*: `*this`.

14 *Throws*:

(14.1) — `out_of_range` if `pos > size()`,

(14.2) — `length_error` if `n > max_size() - size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr iterator insert(const_iterator p, charT c);
```

15 *Preconditions*: `p` is a valid iterator on `*this`.

16 *Effects*: Inserts a copy of `c` at the position `p`.

17 *Returns*: An iterator which refers to the inserted character.

```
constexpr iterator insert(const_iterator p, size_type n, charT c);
```

18 *Preconditions*: `p` is a valid iterator on `*this`.

19 *Effects*: Inserts `n` copies of `c` at the position `p`.

20 *Returns*: An iterator which refers to the first inserted character, or `p` if `n == 0`.

```
template<class InputIterator>
  constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);
```

21 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

22 *Preconditions*: `p` is a valid iterator on `*this`.

23 *Effects*: Equivalent to `insert(p - begin(), basic_string(first, last, get_allocator()))`.

24 *Returns*: An iterator which refers to the first inserted character, or `p` if `first == last`.

```
template<container-compatible-range<charT> R>
  constexpr iterator insert_range(const_iterator p, R&& rg);
```

25 *Preconditions*: `p` is a valid iterator on `*this`.

26 *Effects*: Equivalent to `insert(p - begin(), basic_string(from_range, std::forward<R>(rg), get_allocator()))`.

27 *Returns*: An iterator which refers to the first inserted character, or `p` if `rg` is empty.

```
constexpr iterator insert(const_iterator p, initializer_list<charT> il);
```

28 *Effects*: Equivalent to: `return insert(p, il.begin(), il.end());`

27.4.3.7.5 `basic_string::erase` [string.erase]

```
constexpr basic_string& erase(size_type pos = 0, size_type n = npos);
```

1 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n` and `size() - pos`. Removes the characters in the range [`begin() + pos`, `begin() + pos + xlen`).

2 *Returns*: `*this`.

3 *Throws*: `out_of_range` if `pos > size()`.

```
constexpr iterator erase(const_iterator p);
```

4 *Preconditions*: `p` is a valid dereferenceable iterator on `*this`.

5 *Effects*: Removes the character referred to by `p`.

6 *Returns*: An iterator which points to the element immediately following `p` prior to the element being erased. If no such element exists, `end()` is returned.

7 *Throws*: Nothing.

```
constexpr iterator erase(const_iterator first, const_iterator last);
```

8 *Preconditions*: `first` and `last` are valid iterators on `*this`. [`first`, `last`) is a valid range.

9 *Effects*: Removes the characters in the range [`first`, `last`).

10 *Returns*: An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.

11 *Throws*: Nothing.

```
constexpr void pop_back();
```

12 *Hardened preconditions*: `empty()` is `false`.

13 *Effects*: Equivalent to `erase(end() - 1)`.

14 *Throws*: Nothing.

27.4.3.7.6 `basic_string::replace` [string.replace]

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

1 *Effects*: Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

```
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                                size_type pos2, size_type n2 = npos);
```

2 *Effects*: Equivalent to:

```
return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
```

3 *Constraints*:

(3.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(3.2) — `is_convertible_v<const T&, const charT*>` is `false`.

4 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());
```

```
template<class T>
  constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
                                  size_type pos2, size_type n2 = npos);
```

5 *Constraints*:

(5.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(5.2) — `is_convertible_v<const T&, const charT*>` is `false`.

6 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));
```

```
constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

7 *Preconditions*: [`s`, `s + n2`) is a valid range.

8 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range [`begin() + pos1`, `begin() + pos1 + xlen`) with a copy of the range [`s`, `s + n2`).

9 *Returns*: `*this`.

10 *Throws*:

(10.1) — `out_of_range` if `pos1 > size()`,

(10.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(10.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
```

11 *Effects*: Equivalent to: `return replace(pos, n, s, traits::length(s));`

```
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
```

12 *Effects*: Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range [`begin() + pos1`, `begin() + pos1 + xlen`) with `n2` copies of `c`.

13 *Returns*: `*this`.

14 *Throws*:

(14.1) — `out_of_range` if `pos1 > size()`,

(14.2) — `length_error` if the length of the resulting string would exceed `max_size()`, or

(14.3) — any exceptions thrown by `allocator_traits<Allocator>::allocate`.

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);
```

15 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(str));`

```
template<class T>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);
```

16 *Constraints*:

(16.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(16.2) — `is_convertible_v<const T&, const charT*>` is `false`.

17 *Preconditions*: [`begin()`, `i1`) and [`i1`, `i2`) are valid ranges.

18 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);
```

19 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s, n));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);
```

20 *Effects*: Equivalent to: `return replace(i1, i2, basic_string_view<charT, traits>(s));`

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);
```

21 *Preconditions*: [`begin()`, `i1`) and [`i1`, `i2`) are valid ranges.

22 *Effects*: Equivalent to: `return replace(i1 - begin(), i2 - i1, n, c);`

```
template<class InputIterator>
  constexpr basic_string& replace(const_iterator i1, const_iterator i2,
                                  InputIterator j1, InputIterator j2);
```

23 *Constraints*: `InputIterator` is a type that qualifies as an input iterator (23.2.2.2).

24 *Effects*: Equivalent to: `return replace(i1, i2, basic_string(j1, j2, get_allocator()));`

```
template<container-compatible-range<charT> R>
  constexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);
```

25 *Effects*: Equivalent to:

```
return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));
```

```
constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);
```

26 *Effects*: Equivalent to: `return replace(i1, i2, il.data(), il.size());`

27.4.3.7.7 `basic_string::copy` [string.copy]

```
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).copy(s, n, pos);`

[*Note 1*: This does not terminate `s` with a null object. — *end note*]

27.4.3.7.8 `basic_string::swap` [string.swap]

```
constexpr void swap(basic_string& s)
  noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
           allocator_traits<Allocator>::is_always_equal::value);
```

1 *Preconditions*: `allocator_traits<Allocator>::propagate_on_container_swap::value` is `true` or `get_allocator() == s.get_allocator()`.

2 *Postconditions*: `*this` contains the same sequence of characters that was in `s`, `s` contains the same sequence of characters that was in `*this`.

3 *Throws*: Nothing.

4 *Complexity*: Constant time.

27.4.3.8 String operations [string.ops]

27.4.3.8.1 Accessors [string.accessors]

```
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
constexpr charT* data() noexcept;
```

1 *Returns*: `to_address(begin())`.

2 *Complexity*: Constant time.

```
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

3 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(data(), size());`

```
constexpr allocator_type get_allocator() const noexcept;
```

4 *Returns*: A copy of the `Allocator` object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

27.4.3.8.2 Searching [string.find]

1 Let *F* be one of `find`, `rfind`, `find_first_of`, `find_last_of`, `find_first_not_of`, and `find_last_not_of`.

(1.1) — Each member function of the form

```
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(str), pos);`

(1.2) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s), pos);`

(1.3) — Each member function of the form

```
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: `return F(basic_string_view<charT, traits>(s, n), pos);`

(1.4) — Each member function of the form

```
constexpr size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```
return F(basic_string_view<charT, traits>(addressof(c), 1), pos);
```

```
template<class T>
  constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
```

```
template<class T>
  constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
  constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
  constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);
```

2 *Constraints*:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(2.2) — `is_convertible_v<const T&, const charT*>` is `false`.

3 *Effects*: Let *G* be the name of the function. Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
if (auto result = s.G(sv, pos); result == s.npos) {
  return npos;
} else {
  return result;
}
```

4 *Remarks*: The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

27.4.3.8.3 `basic_string::substr` [string.substr]

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const &;
```

1 *Effects*: Equivalent to: `return basic_string(*this, pos, n);`

```
constexpr basic_string substr(size_type pos = 0, size_type n = npos) &&;
```

2 *Effects*: Equivalent to: `return basic_string(std::move(*this), pos, n);`

```
constexpr basic_string_view<charT, traits> subview(size_type pos = 0, size_type n = npos) const;
```

3 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).subview(pos, n);`

27.4.3.8.4 `basic_string::compare` [string.compare]

```
template<class T>
  constexpr int compare(const T& t) const noexcept(see below);
```

1 *Constraints*:

(1.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(1.2) — `is_convertible_v<const T&, const charT*>` is `false`.

2 *Effects*: Equivalent to: `return basic_string_view<charT, traits>(*this).compare(t);`

3 *Remarks*: The exception specification is equivalent to `is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>`.

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 *Constraints*:

(4.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(4.2) — `is_convertible_v<const T&, const charT*>` is `false`.

5 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```

```
template<class T>
  constexpr int compare(size_type pos1, size_type n1, const T& t,
                        size_type pos2, size_type n2 = npos) const;
```

6 *Constraints*:

(6.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is `true` and

(6.2) — `is_convertible_v<const T&, const charT*>` is `false`.

7 *Effects*: Equivalent to:

```
basic_string_view<charT, traits> s = *this, sv = t;
return s.substr(pos1, n1).compare(sv.substr(pos2, n2));
```

```
constexpr int compare(const basic_string& str) const noexcept;
```

8 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;
```

9 *Effects*: Equivalent to: `return compare(pos1, n1, basic_string_view<charT, traits>(str));`

```
constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
                      size_type pos2, size_type n2 = npos) const;
```

10 *Effects*: Equivalent to:

```
return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
```

```
constexpr int compare(const charT* s) const;
```

11 *Effects*: Equivalent to: `return compare(basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s) const;
```

12 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s));`

```
constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;
```

13 *Effects*: Equivalent to: `return compare(pos, n1, basic_string_view<charT, traits>(s, n2));`

27.4.3.8.5 `basic_string::starts_with` [string.starts.with]

```
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).starts_with(x);
```

27.4.3.8.6 `basic_string::ends_with` [string.ends.with]

```
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).ends_with(x);
```

27.4.3.8.7 `basic_string::contains` [string.contains]

```
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

1 *Effects*: Equivalent to:

```
return basic_string_view<charT, traits>(data(), size()).contains(x);
```

27.4.4 Non-member functions [string.nonmembers]

27.4.4.1 `operator+` [string.op.plus]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

1 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              const basic_string<charT, traits, Allocator>& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);
```

2 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

3 *Effects*: Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

[*Note 1*: If `lhs` and `rhs` have equal allocators, the implementation can move from either. — *end note*]

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              basic_string<charT, traits, Allocator>&& rhs);
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);
```

4 *Effects*: Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

5 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
```

6 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(r.begin(), lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(charT lhs, basic_string<charT, traits, Allocator>&& rhs);
```

7 *Effects*: Equivalent to:

```
rhs.insert(rhs.begin(), lhs);
return std::move(rhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);
```

8 *Effects*: Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);
```

9 *Effects*: Equivalent to:

```
lhs.push_back(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(const basic_string<charT, traits, Allocator>& lhs,
              type_identity_t<basic_string_view<charT, traits>> rhs);
```

10 Equivalent to:

```
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(basic_string<charT, traits, Allocator>&& lhs,
              type_identity_t<basic_string_view<charT, traits>> rhs);
```

11 Equivalent to:

```
lhs.append(rhs);
return std::move(lhs);
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(type_identity_t<basic_string_view<charT, traits>> lhs,
              const basic_string<charT, traits, Allocator>& rhs);
```

12 Equivalent to:

```
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```
template<class charT, class traits, class Allocator>
  constexpr basic_string<charT, traits, Allocator>
    operator+(type_identity_t<basic_string_view<charT, traits>> lhs,
              basic_string<charT, traits, Allocator>&& rhs);
```

13 Equivalent to:

```
rhs.insert(0, lhs);
return std::move(rhs);
```

14 [*Note 2*: Using a specialization of `type_identity_t` as a parameter type ensures that an object of type `basic_string<charT, traits, Allocator>` can be concatenated with an object of a type `T` having an implicit conversion to `basic_string_view<charT, traits>` (12.2.2.3). — *end note*]

27.4.4.2 Non-member comparison operator functions [string.cmp]

```
template<class charT, class traits, class Allocator>
  constexpr bool
    operator==(const basic_string<charT, traits, Allocator>& lhs,
               const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
  constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                            const charT* rhs);

template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                  const basic_string<charT, traits, Allocator>& rhs) noexcept;
template<class charT, class traits, class Allocator>
  constexpr see below operator<=>(const basic_string<charT, traits, Allocator>& lhs,
                                  const charT* rhs);
```

1 *Effects*: Let *op* be the operator. Equivalent to:

```
return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);
```

27.4.4.3 swap [string.special]

```
template<class charT, class traits, class Allocator>
  constexpr void
    swap(basic_string<charT, traits, Allocator>& lhs,
         basic_string<charT, traits, Allocator>& rhs)
      noexcept(noexcept(lhs.swap(rhs)));
```

1 *Effects*: Equivalent to `lhs.swap(rhs)`.

27.4.4.4 Inserters and extractors [string.io]

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);
```

1 *Effects*: Behaves as a formatted input function (31.7.5.3.1). After constructing a `sentry` object, if the `sentry` object returns `true` when converted to a value of type `bool`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)`. If `is.width()` is greater than zero, the maximum number `n` of characters appended is `is.width()`; otherwise `n` is `str.max_size()`. Characters are extracted and appended until any of the following occurs:

(1.1) — *n* characters are stored;

(1.2) — end-of-file occurs on the input sequence;

(1.3) — `isspace(c, is.getloc())` is `true` for the next available input character *c*.

2 After the last character (if any) is extracted, `is.width(0)` is called and the `sentry` object is destroyed.

3 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

4 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const basic_string<charT, traits, Allocator>& str);
```

5 *Effects*: Equivalent to: `return os << basic_string_view<charT, traits>(str);`

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
```

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str,
            charT delim);
```

6 *Effects*: Behaves as an unformatted input function (31.7.5.4), except that it does not affect the value returned by subsequent calls to `basic_istream<>::gcount()`. After constructing a `sentry` object, if the `sentry` object returns `true` when converted to a value of type `bool`, calls `str.erase()` and then extracts characters from `is` and appends them to `str` as if by calling `str.append(1, c)` until any of the following occurs:

(6.1) — end-of-file occurs on the input sequence;

(6.2) — `traits::eq(c, delim)` for the next available input character c (in which case, c is extracted but not appended);

(6.3) — `str.max_size()` characters are stored (in which case, `ios_base::failbit` is set in the input function's local error state).

7 The conditions are tested in the order shown. In any case, after the last character is extracted, the `sentry` object is destroyed.

8 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

9 *Returns*: `is`.

```
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>& is,
            basic_string<charT, traits, Allocator>& str);
template<class charT, class traits, class Allocator>
  basic_istream<charT, traits>&
    getline(basic_istream<charT, traits>&& is,
            basic_string<charT, traits, Allocator>& str);
```

10 *Returns*: `getline(is, str, is.widen('\n'))`.

27.4.4.5 Erasure [string.erasure]

```
template<class charT, class traits, class Allocator, class U = charT>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

1 *Effects*: Equivalent to:

```
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

```
template<class charT, class traits, class Allocator, class Predicate>
  constexpr typename basic_string<charT, traits, Allocator>::size_type
    erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

2 *Effects*: Equivalent to:

```
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
```

27.4.5 Numeric conversions [string.conversions]

```
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
```

```
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

1 *Effects*: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

2 *Returns*: The converted result.

3 *Throws*: `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

4 *Effects*: These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

5 *Returns*: The converted result.

6 *Throws*: `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```
constexpr string to_string(int val);
constexpr string to_string(unsigned val);
constexpr string to_string(long val);
constexpr string to_string(unsigned long val);
constexpr string to_string(long long val);
constexpr string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

7 *Returns*: `format("{}", val)`.

```
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

8 *Effects*: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

9 *Returns*: The converted result.

10 *Throws*: `invalid_argument` if `wcstol`, `wcstoul`, `wcstoll`, or `wcstoull` reports that no conversion can be performed. Throws `out_of_range` if the converted value is outside the range of representable values for the return type.

```
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

11 *Effects*: These functions call `wcstof(str.c_str(), ptr)`, `wcstod(str.c_str(), ptr)`, and `wcstold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument

`ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

12 *Returns*: The converted result.

13 *Throws*: `invalid_argument` if `wcstof`, `wcstod`, or `wcstold` reports that no conversion can be performed. Throws `out_of_range` if `wcstof`, `wcstod`, or `wcstold` sets `errno` to `ERANGE`.

```
constexpr wstring to_wstring(int val);
constexpr wstring to_wstring(unsigned val);
constexpr wstring to_wstring(long val);
constexpr wstring to_wstring(unsigned long val);
constexpr wstring to_wstring(long long val);
constexpr wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

14 *Returns*: `format(L"{}", val)`.

27.4.6 Hash support [basic.string.hash]

```
template<class A> struct hash<basic_string<char, char_traits<char>, A>>;
template<class A> struct hash<basic_string<char8_t, char_traits<char8_t>, A>>;
template<class A> struct hash<basic_string<char16_t, char_traits<char16_t>, A>>;
template<class A> struct hash<basic_string<char32_t, char_traits<char32_t>, A>>;
template<class A> struct hash<basic_string<wchar_t, char_traits<wchar_t>, A>>;
```

1 If `S` is one of these string types, `SV` is the corresponding string view type, and `s` is an object of type `S`, then `hash<S>()(s) == hash<SV>()(SV(s))`.

27.4.7 Suffix for `basic_string` literals [basic.string.literals]

```
constexpr string operator""s(const char* str, size_t len);
```

1 *Returns*: `string{str, len}`.

```
constexpr u8string operator""s(const char8_t* str, size_t len);
```

2 *Returns*: `u8string{str, len}`.

```
constexpr u16string operator""s(const char16_t* str, size_t len);
```

3 *Returns*: `u16string{str, len}`.

```
constexpr u32string operator""s(const char32_t* str, size_t len);
```

4 *Returns*: `u32string{str, len}`.

```
constexpr wstring operator""s(const wchar_t* str, size_t len);
```

5 *Returns*: `wstring{str, len}`.

6 [*Note 1*: The same suffix `s` is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — *end note*]

27.5 Null-terminated sequence utilities [c.strings]

27.5.1 Header <cstring> synopsis [cstring.syn]

```
#define __STDC_VERSION_STRING_H__ 202311L

namespace std {
  using size_t = see 17.2.4;                                    // freestanding

  void* memcpy(void* s1, const void* s2, size_t n);             // freestanding
  void* memccpy(void* s1, const void* s2, int c, size_t n);     // freestanding
  void* memmove(void* s1, const void* s2, size_t n);            // freestanding
  char* strcpy(char* s1, const char* s2);                       // freestanding
  char* strncpy(char* s1, const char* s2, size_t n);            // freestanding
  char* strdup(const char* s);
```

```
  char* strndup(const char* s, size_t size);
  char* strcat(char* s1, const char* s2);                          // freestanding
  char* strncat(char* s1, const char* s2, size_t n);               // freestanding
  int memcmp(const void* s1, const void* s2, size_t n);           // freestanding
  int strcmp(const char* s1, const char* s2);                     // freestanding
  int strcoll(const char* s1, const char* s2);
  int strncmp(const char* s1, const char* s2, size_t n);          // freestanding
  size_t strxfrm(char* s1, const char* s2, size_t n);
  const void* memchr(const void* s, int c, size_t n);            // freestanding; see 16.2
  void* memchr(void* s, int c, size_t n);                         // freestanding; see 16.2
  const char* strchr(const char* s, int c);                       // freestanding; see 16.2
  char* strchr(char* s, int c);                                   // freestanding; see 16.2
  size_t strcspn(const char* s1, const char* s2);                 // freestanding
  const char* strpbrk(const char* s1, const char* s2);            // freestanding; see 16.2
  char* strpbrk(char* s1, const char* s2);                        // freestanding; see 16.2
  const char* strrchr(const char* s, int c);                      // freestanding; see 16.2
  char* strrchr(char* s, int c);                                  // freestanding; see 16.2
  size_t strspn(const char* s1, const char* s2);                  // freestanding
  const char* strstr(const char* s1, const char* s2);             // freestanding; see 16.2
  char* strstr(char* s1, const char* s2);                         // freestanding; see 16.2
  char* strtok(char* s1, const char* s2);
  void* memset(void* s, int c, size_t n);                         // freestanding
  void* memset_explicit(void* s, int c, size_t n);                // freestanding
  char* strerror(int errnum);
  size_t strlen(const char* s);                                   // freestanding
}

#define NULL see 17.2.3                                           // freestanding
```

1 The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`.

2 The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10).

3 The functions `memcpy` and `memmove` are signal-safe (17.14.5). Each of these functions implicitly creates objects (6.8.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination. Each of these functions returns a pointer to a suitable created object, if any, otherwise the value of the first parameter.

4 [*Note 1*: The functions `strchr`, `strpbrk`, `strrchr`, `strstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

28 Text processing library [text]

28.1 General [text.general]

This Clause describes components for dealing with text. These components are summarized in Table 89.

Table 89 — Text library summary [tab:text.summary]

	Subclause	Header
28.2	Primitive numeric conversions	`<charconv>`
28.3	Localization library	`<locale>`, `<clocale>`
28.4	Text encodings identification	`<text_encoding>`
28.5	Formatting	`<format>`
28.6	Regular expressions library	`<regex>`
28.7	Null-terminated sequence utilities	`<cctype>`, `<cstdlib>`, `<cuchar>`, `<cwchar>`, `<cwctype>`

28.2 Primitive numeric conversions [charconv]

28.2.1 Header `<charconv>` synopsis [charconv.syn]

1 When a function is specified with a type placeholder of *integer-type*, the implementation provides overloads for `char` and all signed and unsigned integer types in lieu of *integer-type*. When a function is specified with a type placeholder of *floating-point-type*, the implementation provides overloads for all cv-unqualified floating-point types (6.9.2) in lieu of *floating-point-type*.

```
namespace std {
  // floating-point format for primitive numerical conversion
  enum class chars_format {
    scientific = unspecified,
    fixed = unspecified,
    hex = unspecified,
    general = fixed | scientific
  };

  // 28.2.2, primitive numerical output conversion
  struct to_chars_result {                                          // freestanding
    char* ptr;
    errc ec;
    friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    constexpr explicit operator bool() const noexcept { return ec == errc{}; }
  };

  constexpr to_chars_result to_chars(char* first, char* last,       // freestanding
                                     integer-type value, int base = 10);
  to_chars_result to_chars(char* first, char* last,                 // freestanding
                           bool value, int base = 10) = delete;

  to_chars_result to_chars(char* first, char* last,                 // freestanding-deleted
                           floating-point-type value);
  to_chars_result to_chars(char* first, char* last,                 // freestanding-deleted
                           floating-point-type value, chars_format fmt);
  to_chars_result to_chars(char* first, char* last,                 // freestanding-deleted
                           floating-point-type value, chars_format fmt, int precision);

  // 28.2.3, primitive numerical input conversion
  struct from_chars_result {                                        // freestanding
    const char* ptr;
    errc ec;
    friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
```

```
    constexpr explicit operator bool() const noexcept { return ec == errc{}; }
  };

  constexpr from_chars_result from_chars(const char* first, const char* last,    // freestanding
                                         integer-type& value, int base = 10);

  from_chars_result from_chars(const char* first, const char* last,      // freestanding-deleted
                               floating-point-type& value,
                               chars_format fmt = chars_format::general);
}
```

2 The type `chars_format` is a bitmask type (16.3.3.3.3) with elements `scientific`, `fixed`, and `hex`.

3 The types `to_chars_result` and `from_chars_result` have the data members and special members specified above. They have no base classes or members other than those specified.

28.2.2 Primitive numeric output conversion [charconv.to.chars]

1 All functions named `to_chars` convert `value` into a character string by successively filling the range [`first`, `last`), where [`first`, `last`) is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range [`first`, `last`) are unspecified.

2 The functions that take a floating-point `value` but not a `precision` parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly.

[*Note 1*: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — *end note*]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading `"0x"` in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```
constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
```

4 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

5 *Effects*: The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `'-'`.

6 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value);
```

7 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

8 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
```

9 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

10 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale.

11 *Throws*: Nothing.

```
to_chars_result to_chars(char* first, char* last, floating-point-type value,
                         chars_format fmt, int precision);
```

12 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

13 *Effects*: `value` is converted to a string in the style of `printf` in the `"C"` locale with the given precision.

14 *Throws*: Nothing.

See also: ISO/IEC 9899:2024, 7.23.6.2

28.2.3 Primitive numeric input conversion [charconv.from.chars]

1 All functions named `from_chars` analyze the string [`first`, `last`) for a pattern, where [`first`, `last`) is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`.

[*Note 1*: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — *end note*]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not matching the pattern, or has the value `last` if all characters match. If the parsed value is not in the range representable by the type of `value`, `value` is unmodified and the member `ec` of the return value is equal to `errc::result_out_of_range`. Otherwise, `value` is set to the parsed value, after rounding according to `round_to_nearest` (17.3.4), and the member `ec` is value-initialized.

```
constexpr from_chars_result from_chars(const char* first, const char* last,
                                       integer-type& value, int base = 10);
```

2 *Preconditions*: `base` has a value between 2 and 36 (inclusive).

3 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale for the given nonzero base, as described for `strtol`, except that no `"0b"` or `"0B"` prefix shall appear if the value of `base` is 2, no `"0x"` or `"0X"` prefix shall appear if the value of `base` is 16, and except that `'-'` is the only sign that may appear, and only if `value` has a signed type.

4 *Throws*: Nothing.

```
from_chars_result from_chars(const char* first, const char* last, floating-point-type& value,
                             chars_format fmt = chars_format::general);
```

5 *Preconditions*: `fmt` has the value of one of the enumerators of `chars_format`.

6 *Effects*: The pattern is the expected form of the subject sequence in the `"C"` locale, as described for `strtod`, except that

(6.1) — the sign `'+'` may only appear in the exponent part;

(6.2) — if `fmt` has `chars_format::scientific` set but not `chars_format::fixed`, the otherwise optional exponent part shall appear;

(6.3) — if `fmt` has `chars_format::fixed` set but not `chars_format::scientific`, the optional exponent part shall not appear; and

(6.4) — if `fmt` is `chars_format::hex`, the prefix `"0x"` or `"0X"` is assumed.

[*Example 1*: The string `0x123` is parsed to have the value `0` with remaining characters `x123`. — *end example*]

In any case, the resulting `value` is one of at most two floating-point values closest to the value of the string matching the pattern.

7 *Throws*: Nothing.

28.3 Localization library [localization]

28.3.1 General [localization.general]

1 Subclause 28.3 describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

2 The following subclauses describe components for locales themselves, the standard facets, and facilities from the C library, as summarized in Table 90.

Table 90 — Localization library summary [tab:localization.summary]

	Subclause	Header
28.3.3	Locales	`<locale>`
28.3.4	Standard `locale` categories	
28.3.5	C library locales	`<clocale>`

28.3.2 Header `<locale>` synopsis [locale.syn]

```
namespace std {
  // 28.3.3.1, locale
  class locale;
  template<class Facet> const Facet& use_facet(const locale&);

}
```

1 The header <locale> defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.[193]

28.3.3 Locales [locales]

28.3.3.1 Class locale [locale]

28.3.3.1.1 General [locale.general]

```
namespace std {
  class locale {
  public:
    // 28.3.3.1.2, types
    // 28.3.3.1.2.2, class locale::facet
    class facet;
    // 28.3.3.1.2.3, class locale::id
    class id;
    // 28.3.3.1.2.1, type locale::category
    using category = int;
    static const category   // values assigned here are for exposition only
      none     = 0,
      collate  = 0x010, ctype    = 0x020,
      monetary = 0x040, numeric  = 0x080,
      time     = 0x100, messages = 0x200,
      all = collate | ctype | monetary | numeric | time | messages;

    // 28.3.3.1.3, construct/copy/destroy
    locale() noexcept;
    locale(const locale& other) noexcept;
    explicit locale(const char* std_name);
    explicit locale(const string& std_name);
    locale(const locale& other, const char* std_name, category);
    locale(const locale& other, const string& std_name, category);
    template<class Facet> locale(const locale& other, Facet* f);
    locale(const locale& other, const locale& one, category);
    ~locale();                    // not virtual
    const locale& operator=(const locale& other) noexcept;

    // 28.3.3.1.4, locale operations
    template<class Facet> locale combine(const locale& other) const;
    string name() const;
    text_encoding encoding() const;

    bool operator==(const locale& other) const;
```

193) In this subclause, the type name tm is an incomplete type that is defined in <ctime> (30.15).

```
    template<class charT, class traits, class Allocator>
      bool operator()(const basic_string<charT, traits, Allocator>& s1,
                      const basic_string<charT, traits, Allocator>& s2) const;

    // 28.3.3.1.6, global locale objects
    static       locale  global(const locale&);
    static const locale& classic();
  };
}
```

1 Class `locale` implements a type-safe polymorphic set of facets, indexed by facet *type*. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.

2 Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.

3 [*Example 1*: An iostream `operator<<` can be implemented as:[194]

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<< (basic_ostream<charT, traits>& s, Date d) {
  typename basic_ostream<charT, traits>::sentry cerberos(s);
  if (cerberos) {
    tm tmbuf; d.extract(tmbuf);
    bool failed =
      use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(
        s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
    if (failed)
      s.setstate(s.badbit);      // can throw
  }
  return s;
}
```

— *end example*]

4 In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.

5 [*Note 1*: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

(5.1) — A member operator template

```
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.5.3).)

— *end note*]

6 Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

7 In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

8 A `locale` constructed from a name string (such as `"POSIX"`), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string `"*"`.

9 Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

194) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`.

28.3.3.1.2 Types [locale.types]

28.3.3.1.2.1 Type `locale::category` [locale.category]

```
using category = int;
```

1 *Valid* `category` values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 91.

Table 91 — Locale category facets [tab:locale.category.facets]

Category	Includes facets
collate	`collate<char>`, `collate<wchar_t>`
ctype	`ctype<char>`, `ctype<wchar_t>` `codecvt<char, char, mbstate_t>` `codecvt<wchar_t, char, mbstate_t>`
monetary	`moneypunct<char>`, `moneypunct<wchar_t>` `moneypunct<char, true>`, `moneypunct<wchar_t, true>` `money_get<char>`, `money_get<wchar_t>` `money_put<char>`, `money_put<wchar_t>`
numeric	`numpunct<char>`, `numpunct<wchar_t>` `num_get<char>`, `num_get<wchar_t>` `num_put<char>`, `num_put<wchar_t>`
time	`time_get<char>`, `time_get<wchar_t>` `time_put<char>`, `time_put<wchar_t>`
messages	`messages<char>`, `messages<wchar_t>`

3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 91, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

4 An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 92.

5 The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(l)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

6 In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the *Cpp17InputIterator* requirements or *Cpp17OutputIterator* requirements, respectively (24.3). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character container types (3.10) that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

28.3.3.1.2.2 Class `locale::facet` [locale.facet]

```
namespace std {
  class locale::facet {
  protected:
    explicit facet(size_t refs = 0);
    virtual ~facet();
    facet(const facet&) = delete;
```

Table 92 — Required specializations **[tab:locale.spec]**

Category	Includes facets
collate	`collate_byname<char>`, `collate_byname<wchar_t>`
ctype	`ctype_byname<char>`, `ctype_byname<wchar_t>` `codecvt_byname<char, char, mbstate_t>` `codecvt_byname<wchar_t, char, mbstate_t>`
monetary	`moneypunct_byname<char, International>` `moneypunct_byname<wchar_t, International>` `money_get<C, InputIterator>` `money_put<C, OutputIterator>`
numeric	`numpunct_byname<char>`, `numpunct_byname<wchar_t>` `num_get<C, InputIterator>`, `num_put<C, OutputIterator>`
time	`time_get<char, InputIterator>` `time_get_byname<char, InputIterator>` `time_get<wchar_t, InputIterator>` `time_get_byname<wchar_t, InputIterator>` `time_put<char, OutputIterator>` `time_put_byname<char, OutputIterator>` `time_put<wchar_t, OutputIterator>` `time_put_byname<wchar_t, OutputIterator>`
messages	`messages_byname<char>`, `messages_byname<wchar_t>`

```
    void operator=(const facet&) = delete;
  };
}
```

1 Class `facet` is the base class for locale feature sets. A class is a *facet* if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:[195]

```
static ::std::locale::id id;
```

2 Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3 The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4 Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are explicit, preventing their participation in implicit conversions.

5 For some standard facets a standard "`..._byname`" class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no "`..._byname`" version of a facet, the base class implements named locale semantics itself by reference to other facets.

28.3.3.1.2.3 Class `locale::id` [locale.id]

```
namespace std {
  class locale::id {
  public:
    id();
    void operator=(const id&) = delete;
```

195) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

```
    id(const id&) = delete;
  };
}
```

1 The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

2 [*Note 1*: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet's `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.10.3.2). — *end note*]

28.3.3.1.3 Constructors and destructor [locale.cons]

```
locale() noexcept;
```

1 *Effects*: Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[*Note 1*: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — *end note*]

```
explicit locale(const char* std_name);
```

2 *Effects*: Constructs a locale using standard C locale names, e.g., `"POSIX"`. The resulting locale implements semantics defined to be associated with that name.

3 *Throws*: `runtime_error` if the argument is not valid, or is null.

4 *Remarks*: The set of valid string argument values is `"C"`, `""`, and any implementation-defined values.

```
explicit locale(const string& std_name);
```

5 *Effects*: Equivalent to `locale(std_name.c_str())`.

```
locale(const locale& other, const char* std_name, category cats);
```

6 *Preconditions*: `cats` is a valid `category` value (28.3.3.1.2.1).

7 *Effects*: Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

8 *Throws*: `runtime_error` if the second argument is not valid, or is null.

9 *Remarks*: The locale has a name if and only if `other` has a name.

```
locale(const locale& other, const string& std_name, category cats);
```

10 *Effects*: Equivalent to `locale(other, std_name.c_str(), cats)`.

```
template<class Facet> locale(const locale& other, Facet* f);
```

11 *Effects*: Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

12 *Remarks*: If `f` is null, the resulting locale has the same name as `other`. Otherwise, the resulting locale has no name.

```
locale(const locale& other, const locale& one, category cats);
```

13 *Preconditions*: `cats` is a valid `category` value.

14 *Effects*: Constructs a locale incorporating all facets from the first argument except those that implement `cats`, which are instead incorporated from the second argument.

15 *Remarks*: If `cats` is equal to `locale::none`, the resulting locale has a name if and only if the first argument has a name. Otherwise, the resulting locale has a name if and only if the first two arguments both have names.

```
const locale& operator=(const locale& other) noexcept;
```

16 *Effects*: Creates a copy of `other`, replacing the current value.

17 *Returns*: `*this`.

28.3.3.1.4 Members [locale.members]

```
template<class Facet> locale combine(const locale& other) const;
```

1 *Effects*: Constructs a locale incorporating all facets from `*this` except for that one facet of `other` that is identified by `Facet`.

2 *Returns*: The newly created locale.

3 *Throws*: `runtime_error` if `has_facet<Facet>(other)` is `false`.

4 *Remarks*: The resulting locale has no name.

```
string name() const;
```

5 *Returns*: The name of `*this`, if it has one; otherwise, the string `"*"`.

```
text_encoding encoding() const;
```

6 *Mandates*: `CHAR_BIT == 8` is `true`.

7 *Returns*: A `text_encoding` object representing the implementation-defined encoding scheme associated with the locale `*this`.

28.3.3.1.5 Operators [locale.operators]

```
bool operator==(const locale& other) const;
```

1 *Returns*: `true` if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; `false` otherwise.

```
template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;
```

2 *Effects*: Compares two strings according to the `std::collate<charT>` facet.

3 *Returns*:

```
use_facet<std::collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
                                              s2.data(), s2.data() + s2.size()) < 0
```

4 *Remarks*: This member operator template (and therefore `locale` itself) meets the requirements for a comparator predicate template argument (Clause 26) applied to strings.

5 [*Example 1*: A vector of strings `v` can be collated according to collation rules in locale `loc` simply by (26.8.2, 23.3.13):

```
std::sort(v.begin(), v.end(), loc);
```

— *end example*]

28.3.3.1.6 Static members [locale.statics]

```
static locale global(const locale& loc);
```

1 *Effects*: Sets the global locale to its argument. Causes future calls to the constructor `locale()` to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```

otherwise, the effect on the C locale, if any, is implementation-defined.

2 *Returns*: The previous value of `locale()`.

3 *Remarks*: No library function other than `locale::global()` affects the value returned by `locale()`.

[*Note 1*: See 28.3.5 for data race considerations when `setlocale` is invoked. — *end note*]

```
static const locale& classic();
```

4 The `"C"` locale.

5 *Returns*: A locale that implements the classic `"C"` locale semantics, equivalent to the value `locale("C")`.

6 *Remarks*: This locale, its facets, and their member functions, do not change with time.

28.3.3.2 `locale` globals [locale.global.templates]

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

1 *Mandates*: `Facet` is a facet class whose definition contains the public static member `id` as defined in 28.3.3.1.2.2.

2 *Returns*: A reference to the corresponding facet of `loc`, if present.

3 *Throws*: `bad_cast` if `has_facet<Facet>(loc)` is `false`.

4 *Remarks*: The reference returned remains valid at least as long as any copy of `loc` exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

5 *Returns*: `true` if the facet requested is present in `loc`; otherwise `false`.

28.3.3.3 Convenience interfaces [locale.convenience]

28.3.3.3.1 Character classification [classification]

```
template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit(charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);
```

1 Each of these functions `is`*F* returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where *F* is the `ctype_base::mask` value corresponding to that function (28.3.4.2).[196]

28.3.3.3.2 Character conversions [conversions.character]

```
template<class charT> charT toupper(charT c, const locale& loc);
```

1 *Returns*: `use_facet<ctype<charT>>(loc).toupper(c)`.

```
template<class charT> charT tolower(charT c, const locale& loc);
```

2 *Returns*: `use_facet<ctype<charT>>(loc).tolower(c)`.

28.3.4 Standard `locale` categories [locale.categories]

28.3.4.1 General [locale.categories.general]

1 Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators `<<` and `>>`, as members `put()` and `get()`, respectively. Each such member function takes an `ios_base&` argument whose members `flags()`, `precision()`, and `width()`, specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member `getloc()` to retrieve the locale imbued there. Formatting facets use the character argument `fill` to fill out the specified width where necessary.

2 The `put()` members make no provision for error reporting. (Any failures of the `OutputIterator` argument can be extracted from the returned iterator.) The `get()` members take an `ios_base::iostate&` argument whose value they ignore, but set to `ios_base::failbit` in case of a parse error.

3 Within 28.3.4 it is unspecified whether one virtual function calls another virtual function.

196) When used in a loop, it is faster to cache the `ctype<>` facet and use it directly, or use the vector form of `ctype<>::is`.

28.3.4.2 The ctype category [category.ctype]

28.3.4.2.1 General [category.ctype.general]

```
namespace std {
  class ctype_base {
  public:
    using mask = see below;

    // numeric values are for exposition only.
    static constexpr mask space  = 1 << 0;
    static constexpr mask print  = 1 << 1;
    static constexpr mask cntrl  = 1 << 2;
    static constexpr mask upper  = 1 << 3;
    static constexpr mask lower  = 1 << 4;
    static constexpr mask alpha  = 1 << 5;
    static constexpr mask digit  = 1 << 6;
    static constexpr mask punct  = 1 << 7;
    static constexpr mask xdigit = 1 << 8;
    static constexpr mask blank  = 1 << 9;
    static constexpr mask alnum  = alpha | digit;
    static constexpr mask graph  = alnum | punct;
  };
}
```

1 The type `mask` is a bitmask type (16.3.3.3.3).

28.3.4.2.2 Class template ctype [locale.ctype]

28.3.4.2.2.1 General [locale.ctype.general]

```
namespace std {
  template<class charT>
  class ctype : public locale::facet, public ctype_base {
  public:
    using char_type = charT;

    explicit ctype(size_t refs = 0);

    bool         is(mask m, charT c) const;
    const charT* is(const charT* low, const charT* high, mask* vec) const;
    const charT* scan_is(mask m, const charT* low, const charT* high) const;
    const charT* scan_not(mask m, const charT* low, const charT* high) const;
    charT        toupper(charT c) const;
    const charT* toupper(charT* low, const charT* high) const;
    charT        tolower(charT c) const;
    const charT* tolower(charT* low, const charT* high) const;

    charT        widen(char c) const;
    const char*  widen(const char* low, const char* high, charT* to) const;
    char         narrow(charT c, char dfault) const;
    const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

    static locale::id id;

  protected:
    ~ctype();
    virtual bool         do_is(mask m, charT c) const;
    virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
    virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
    virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
    virtual charT        do_toupper(charT) const;
    virtual const charT* do_toupper(charT* low, const charT* high) const;
    virtual charT        do_tolower(charT) const;
    virtual const charT* do_tolower(charT* low, const charT* high) const;
    virtual charT        do_widen(char) const;
    virtual const char*  do_widen(const char* low, const char* high, charT* dest) const;
```

```
    virtual char         do_narrow(charT, char dfault) const;
    virtual const charT* do_narrow(const charT* low, const charT* high,
                                   char dfault, char* dest) const;
  };
}
```

1 Class `ctype` encapsulates the C library `<cctype>` (28.7.1) features. `istream` members are required to use `ctype<>` for character classing during input parsing.

2 The specializations required in Table 91 (28.3.3.1.2.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation's native character set.

28.3.4.2.2.2 `ctype` members [locale.ctype.members]

```
bool         is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
```

1 *Returns*: `do_is(m, c)` or `do_is(low, high, vec)`.

```
const charT* scan_is(mask m, const charT* low, const charT* high) const;
```

2 *Returns*: `do_scan_is(m, low, high)`.

```
const charT* scan_not(mask m, const charT* low, const charT* high) const;
```

3 *Returns*: `do_scan_not(m, low, high)`.

```
charT        toupper(charT c) const;
const charT* toupper(charT* low, const charT* high) const;
```

4 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`.

```
charT        tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;
```

5 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`.

```
charT       widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
```

6 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`.

```
char         narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;
```

7 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`.

28.3.4.2.2.3 `ctype` virtual functions [locale.ctype.virtuals]

```
bool         do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
```

1 *Effects*: Classifies a character or sequence of characters. For each argument character, identifies a value `M` of type `ctype_base::mask`. The second form identifies a value `M` of type `ctype_base::mask` for each `*p` where `(low <= p && p < high)`, and places it into `vec[p - low]`.

2 *Returns*: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
```

3 *Effects*: Locates a character in a buffer that conforms to a classification `m`.

4 *Returns*: The smallest pointer `p` in the range [`low`, `high`) such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

5 *Effects*: Locates a character in a buffer that fails to conform to a classification `m`.

6 *Returns*: The smallest pointer `p`, if any, in the range [`low`, `high`) such that `is(m, *p)` would return `false`; otherwise, returns `high`.

```
charT        do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

7 *Effects*: Converts a character or characters to upper case. The second form replaces each character `*p` in the range [`low`, `high`) for which a corresponding upper-case character exists, with that character.

8 *Returns*: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;
```

9 *Effects*: Converts a character or characters to lower case. The second form replaces each character `*p` in the range [`low`, `high`) and for which a corresponding lower-case character exists, with that character.

10 *Returns*: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns `high`.

```
charT        do_widen(char c) const;
const char*  do_widen(const char* low, const char* high, charT* dest) const;
```

11 *Effects*: Applies the simplest reasonable transformation from a `char` value or sequence of `char` values to the corresponding `charT` value or values.[197] The only characters for which unique transformations are required are those in the basic character set (5.3.1).

For any named `ctype` category with a `ctype<char>` facet `ctc` and valid `ctype_base::mask` value `M`, `(ctc.is(M, c) || !is(M, do_widen(c)) )` is `true`.[198]

The second form transforms each character `*p` in the range [`low`, `high`), placing the result in `dest[p - low]`.

12 *Returns*: The first form returns the transformed value. The second form returns `high`.

```
char         do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
```

13 *Effects*: Applies the simplest reasonable transformation from a `charT` value or sequence of `charT` values to the corresponding `char` value or values.

For any character `c` in the basic character set (5.3.1) the transformation is such that

```
do_widen(do_narrow(c, 0)) == c
```

For any named `ctype` category with a `ctype<char>` facet `ctc` however, and `ctype_base::mask` value `M`,

```
(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )
```

is `true` (unless `do_narrow` returns `dfault`). In addition, for any digit character `c`, the expression `(do_narrow(c, dfault) - '0')` evaluates to the digit value of the character. The second form transforms each character `*p` in the range [`low`, `high`), placing the result (or `dfault` if no simple transformation is readily available) in `dest[p - low]`.

14 *Returns*: The first form returns the transformed value; or `dfault` if no mapping is readily available. The second form returns `high`.

28.3.4.2.3 Class template `ctype_byname` [locale.ctype.byname]

```
namespace std {
  template<class charT>
  class ctype_byname : public ctype<charT> {
  public:
    using mask = ctype<charT>::mask;
    explicit ctype_byname(const char*, size_t refs = 0);
    explicit ctype_byname(const string&, size_t refs = 0);

  protected:
    ~ctype_byname();
```

197) The parameter `c` of `do_widen` is intended to accept values derived from *character-literal*s for conversion to the locale's encoding.

198) In other words, the transformed character is not a member of any character classification that `c` is not also a member of.

```
  };
}
```

28.3.4.2.4 ctype<char> specialization [facet.ctype.special]

28.3.4.2.4.1 General [facet.ctype.special.general]

```
namespace std {
  template<>
  class ctype<char> : public locale::facet, public ctype_base {
  public:
    using char_type = char;

    explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

    bool is(mask m, char c) const;
    const char* is(const char* low, const char* high, mask* vec) const;
    const char* scan_is (mask m, const char* low, const char* high) const;
    const char* scan_not(mask m, const char* low, const char* high) const;

    char        toupper(char c) const;
    const char* toupper(char* low, const char* high) const;
    char        tolower(char c) const;
    const char* tolower(char* low, const char* high) const;

    char  widen(char c) const;
    const char* widen(const char* low, const char* high, char* to) const;
    char  narrow(char c, char dfault) const;
    const char* narrow(const char* low, const char* high, char dfault, char* to) const;

    static locale::id id;
    static const size_t table_size = implementation-defined;

    const mask* table() const noexcept;
    static const mask* classic_table() noexcept;

  protected:
    ~ctype();
    virtual char        do_toupper(char c) const;
    virtual const char* do_toupper(char* low, const char* high) const;
    virtual char        do_tolower(char c) const;
    virtual const char* do_tolower(char* low, const char* high) const;

    virtual char        do_widen(char c) const;
    virtual const char* do_widen(const char* low, const char* high, char* to) const;
    virtual char        do_narrow(char c, char dfault) const;
    virtual const char* do_narrow(const char* low, const char* high,
                                  char dfault, char* to) const;
  };
}
```

1 A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.[199] The implementation-defined value of member `table_size` is at least 256.

28.3.4.2.4.2 Destructor [facet.ctype.char.dtor]

```
~ctype();
```

1 *Effects*: If the constructor's first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

199) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.

28.3.4.2.4.3 Members [facet.ctype.char.members]

1 In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

2 *Preconditions*: Either `tbl == nullptr` is `true` or [`tbl`, `tbl + table_size`) is a valid range.

3 *Effects*: Passes its `refs` argument to its base class constructor.

```
bool        is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

4 *Effects*: The second form, for all `*p` in the range [`low`, `high`), assigns into `vec[p - low]` the value `table()[(unsigned char)*p]`.

5 *Returns*: The first form returns `table()[(unsigned char)c] & m`; the second form returns `high`.

```
const char* scan_is(mask m, const char* low, const char* high) const;
```

6 *Returns*: The smallest `p` in the range [`low`, `high`) such that

```
table()[(unsigned char) *p] & m
```

is `true`.

```
const char* scan_not(mask m, const char* low, const char* high) const;
```

7 *Returns*: The smallest `p` in the range [`low`, `high`) such that

```
table()[(unsigned char) *p] & m
```

is `false`.

```
char        toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

8 *Returns*: `do_toupper(c)` or `do_toupper(low, high)`, respectively.

```
char        tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

9 *Returns*: `do_tolower(c)` or `do_tolower(low, high)`, respectively.

```
char  widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

10 *Returns*: `do_widen(c)` or `do_widen(low, high, to)`, respectively.

```
char        narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;
```

11 *Returns*: `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

```
const mask* table() const noexcept;
```

12 *Returns*: The first constructor argument, if it was nonzero, otherwise `classic_table()`.

28.3.4.2.4.4 Static members [facet.ctype.char.statics]

```
static const mask* classic_table() noexcept;
```

1 *Returns*: A pointer to the initial element of an array of size `table_size` which represents the classifications of characters in the `"C"` locale.

28.3.4.2.4.5 Virtual functions [facet.ctype.char.virtuals]

```
char        do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char        do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```

```
virtual char        do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char        do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
                              char dfault, char* to) const;
```

1 These functions are described identically as those members of the same name in the `ctype` class template (28.3.4.2.2.2).

28.3.4.2.5 Class template `codecvt` [locale.codecvt]

28.3.4.2.5.1 General [locale.codecvt.general]

```
namespace std {
  class codecvt_base {
  public:
    enum result { ok, partial, error, noconv };
  };

  template<class internT, class externT, class stateT>
  class codecvt : public locale::facet, public codecvt_base {
  public:
    using intern_type = internT;
    using extern_type = externT;
    using state_type  = stateT;

    explicit codecvt(size_t refs = 0);

    result out(
      stateT& state,
      const internT* from, const internT* from_end, const internT*& from_next,
            externT*   to,       externT*   to_end,       externT*&   to_next) const;

    result unshift(
      stateT& state,
            externT*    to,      externT*   to_end,       externT*&   to_next) const;

    result in(
      stateT& state,
      const externT* from, const externT* from_end, const externT*& from_next,
            internT*   to,       internT*   to_end,       internT*&   to_next) const;

    int encoding() const noexcept;
    bool always_noconv() const noexcept;
    int length(stateT&, const externT* from, const externT* end, size_t max) const;
    int max_length() const noexcept;

    static locale::id id;

  protected:
    ~codecvt();
    virtual result do_out(
      stateT& state,
      const internT* from, const internT* from_end, const internT*& from_next,
            externT* to,         externT*   to_end,       externT*&   to_next) const;
    virtual result do_in(
      stateT& state,
      const externT* from, const externT* from_end, const externT*& from_next,
            internT* to,         internT*   to_end,       internT*&   to_next) const;
    virtual result do_unshift(
      stateT& state,
            externT* to,         externT*   to_end,       externT*&   to_next) const;

    virtual int do_encoding() const noexcept;
    virtual bool do_always_noconv() const noexcept;
    virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;
```

```
    virtual int do_max_length() const noexcept;
  };
}
```

1 The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

2 The `stateT` argument selects the pair of character encodings being mapped between.

3 The specializations required in Table 91 (28.3.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

28.3.4.2.5.2 Members [locale.codecvt.members]

```
result out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;
```

1 *Returns*: `do_out(state, from, from_end, from_next, to, to_end, to_next)`.

```
result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

2 *Returns*: `do_unshift(state, to, to_end, to_next)`.

```
result in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

3 *Returns*: `do_in(state, from, from_end, from_next, to, to_end, to_next)`.

```
int encoding() const noexcept;
```

4 *Returns*: `do_encoding()`.

```
bool always_noconv() const noexcept;
```

5 *Returns*: `do_always_noconv()`.

```
int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

6 *Returns*: `do_length(state, from, from_end, max)`.

```
int max_length() const noexcept;
```

7 *Returns*: `do_max_length()`.

28.3.4.2.5.3 Virtual functions [locale.codecvt.virtuals]

```
result do_out(
  stateT& state,
  const internT* from, const internT* from_end, const internT*& from_next,
  externT* to, externT* to_end, externT*& to_next) const;

result do_in(
  stateT& state,
  const externT* from, const externT* from_end, const externT*& from_next,
  internT* to, internT* to_end, internT*& to_next) const;
```

1 *Preconditions*: `(from <= from_end && to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

2 *Effects*: Translates characters in the source range [`from`, `from_end`), placing the results in sequential positions starting at destination `to`. Converts no more than `(from_end - from)` source elements, and stores no more than `(to_end - to)` destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the `from_next` and `to_next` pointers pointing one beyond the last element successfully converted. If it returns `noconv`, `internT` and `externT` are the same type, and the converted sequence is identical to the input sequence [`from`, `from_next`), `to_next` is set equal to `to`, the value of `state` is unchanged, and there are no changes to the values in [`to`, `to_end`).

4 A `codecvt` facet that is used by `basic_filebuf` (31.10) shall have the property that if

```
do_out(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `from != from_end`, then

```
do_out(state, from, from + 1, from_next, to, to_end, to_next)
```

shall also return `ok`, and that if

```
do_in(state, from, from_end, from_next, to, to_end, to_next)
```

would return `ok`, where `to != to_end`, then

```
do_in(state, from, from_end, from_next, to, to + 1, to_next)
```

shall also return `ok`.[200]

[*Note 1*: As a result of operations on `state`, it can return `ok` or `partial` and set `from_next == from` and `to_next != to`. — *end note*]

5 *Returns*: An enumeration value, as summarized in Table 93.

Table 93 — `do_in/do_out` result values [tab:locale.codecvt.inout]

Value	Meaning
`ok`	completed the conversion
`partial`	not all source characters converted
`error`	encountered a character in [`from`, `from_end`) that cannot be converted
`noconv`	`internT` and `externT` are the same type, and input sequence is identical to converted sequence

A return value of `partial`, if `(from_next == from_end)`, indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

6 *Remarks*: Its operations on `state` are unspecified.

[*Note 2*: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. — *end note*]

```
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

7 *Preconditions*: `(to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

8 *Effects*: Places characters starting at `to` that should be appended to terminate a sequence when the current `stateT` is given by `state`.[201] Stores no more than `(to_end - to)` destination elements, and leaves the `to_next` pointer pointing one beyond the last element successfully stored.

9 *Returns*: An enumeration value, as summarized in Table 94.

200) Informally, this means that `basic_filebuf` assumes that the mappings from internal to external characters is 1 to N: that a `codecvt` facet that is used by `basic_filebuf` can translate characters one internal character at a time.
201) Typically these will be characters to return the state to `stateT()`.

Table 94 — `do_unshift` result values [tab:locale.codecvt.unshift]

Value	Meaning
`ok`	completed the sequence
`partial`	space for more than `to_end - to` destination elements was needed to terminate a sequence given the value of `state`
`error`	an unspecified error has occurred
`noconv`	no termination is needed for this `state_type`

```
int do_encoding() const noexcept;
```

10 *Returns*: `-1` if the encoding of the `externT` sequence is state-dependent; else the constant number of `externT` characters needed to produce an internal character; or `0` if this number is not a constant.[202]

```
bool do_always_noconv() const noexcept;
```

11 *Returns*: `true` if `do_in()` and `do_out()` return `noconv` for all valid argument values. `codecvt<char, char, mbstate_t>` returns `true`.

```
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

12 *Preconditions*: `(from <= from_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

13 *Effects*: The effect on the `state` argument is as if it called `do_in(state, from, from_end, from, to, to + max, to)` for `to` pointing to a buffer of at least `max` elements.

14 *Returns*: `(from_next - from)` where `from_next` is the largest value in the range [`from`, `from_end`] such that the sequence of values in the range [`from`, `from_next`) represents `max` or fewer valid complete characters of type `internT`. The specialization `codecvt<char, char, mbstate_t>`, returns the lesser of `max` and `(from_end - from)`.

```
int do_max_length() const noexcept;
```

15 *Returns*: The maximum value that `do_length(state, from, from_end, 1)` can return for any valid range [`from`, `from_end`) and `stateT` value `state`. The specialization `codecvt<char, char, mbstate_t>::do_max_length()` returns 1.

28.3.4.2.6 Class template `codecvt_byname` [locale.codecvt.byname]

```
namespace std {
  template<class internT, class externT, class stateT>
  class codecvt_byname : public codecvt<internT, externT, stateT> {
  public:
    explicit codecvt_byname(const char*, size_t refs = 0);
    explicit codecvt_byname(const string&, size_t refs = 0);

  protected:
    ~codecvt_byname();
  };
}
```

28.3.4.3 The numeric category [category.numeric]

28.3.4.3.1 General [category.numeric.general]

1 The classes `num_get<>` and `num_put<>` handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.[203]

202) If `encoding()` yields `-1`, then more than `max_length()` `externT` elements can be consumed when producing a single `internT` character, and additional `externT` elements can appear at the end of a sequence after those that yield the final `internT` character.
203) Parsing `"-1"` correctly into, e.g., an `unsigned short` requires that the corresponding member `get()` at least extract the sign before delegating.

[2] All specifications of member functions for `num_put` and `num_get` in the subclauses of 28.3.4.3 only apply to the specializations required in Tables 91 and 92 (28.3.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (28.3.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

[3] Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

28.3.4.3.2 Class template `num_get` [locale.num.get]

28.3.4.3.2.1 General [locale.num.get.general]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
  class num_get : public locale::facet {
  public:
    using char_type = charT;
    using iter_type = InputIterator;

    explicit num_get(size_t refs = 0);

    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, bool& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned short& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned int& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, unsigned long long& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, float& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, double& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, long double& v) const;
    iter_type get(iter_type in, iter_type end, ios_base&,
                  ios_base::iostate& err, void*& v) const;

    static locale::id id;

  protected:
    ~num_get();
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, bool& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, long long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, unsigned short& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, unsigned int& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, unsigned long& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, unsigned long long& v) const;
```

```
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, float& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, long double& v) const;
    virtual iter_type do_get(iter_type, iter_type, ios_base&,
                             ios_base::iostate& err, void*& v) const;
  };
}
```

1 The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

28.3.4.3.2.2 Members [facet.num.get.members]

```
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str,
              ios_base::iostate& err, void*& val) const;
```

1 *Returns*: `do_get(in, end, str, err, val)`.

28.3.4.3.2.3 Virtual functions [facet.num.get.virtuals]

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, void*& val) const;
```

1 *Effects*: Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT>>(loc)`, and `use_facet<numpunct<charT>>(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages:

(2.1) — Stage 1: Determine a conversion specifier.

(2.2) — Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results.

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

```
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 95. The table is ordered. That is, the first line whose condition is true applies.

Table 95 — Integer conversions **[tab:facet.num.get.int]**

State	stdio equivalent
`basefield == oct`	`%o`
`basefield == hex`	`%X`
`basefield == 0`	`%i`
`signed` integral type	`%d`
`unsigned` integral type	`%u`

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 96.

Table 96 — Length modifier **[tab:facet.num.get.length]**

Type	Length modifier
`short`	`h`
`unsigned short`	`h`
`long`	`l`
`unsigned long`	`l`
`long long`	`ll`
`unsigned long long`	`ll`
`double`	`l`
`long double`	`L`

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
  c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>(loc).thousands_sep()
  && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

```
static const char src[] = "0123456789abcdefpxABCDEFPX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of `loc`.

If `discard` is `true`, then if `'.'` has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if `'.'` has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a

check is made to determine if `c` is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then `in` is advanced by `++in` and processing returns to the beginning of stage 2.

[*Example 1*: Given an input sequence of `"0x1a.bp+07p"`,

(3.1) — if the conversion specifier returned by Stage 1 is `%d`, `"0"` is accumulated;

(3.2) — if the conversion specifier returned by Stage 1 is `%i`, `"0x1a"` are accumulated;

(3.3) — if the conversion specifier returned by Stage 1 is `%g`, `"0x1a.bp+07"` are accumulated.

In all cases, the remainder is left in the input. — *end example*]

Stage 3: The sequence of `char`s accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header `<cstdlib>` (17.2.2):

(3.4) — For a signed integer value, the function `strtoll`.

(3.5) — For an unsigned integer value, the function `strtoull`.

(3.6) — For a `float` value, the function `strtof`.

(3.7) — For a `double` value, the function `strtod`.

(3.8) — For a `long double` value, the function `strtold`.

The numeric value to be stored can be one of:

(3.9) — zero, if the conversion function does not convert the entire field.

(3.10) — the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in `val`.

(3.11) — the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in `val`.

(3.12) — the converted value, otherwise.

The resultant numeric value is stored in `val`. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, `ios_base::failbit` is assigned to `err`.

4 Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with `use_facet<numpunct<charT>>(loc).grouping()`. If they are not consistent then `ios_base::failbit` is assigned to `err`.

5 In any case, if stage 2 processing was terminated by the test for `in == end` then `err |= ios_base::eofbit` is performed.

```
iter_type do_get(iter_type in, iter_type end, ios_base& str,
                 ios_base::iostate& err, bool& val) const;
```

6 *Effects*: If `(str.flags() & ios_base::boolalpha) == 0` then input proceeds as it would for a `long` except that if a value is being stored into `val`, the value is determined according to the following: If the value to be stored is 0 then `false` is stored. If the value is `1` then `true` is stored. Otherwise `true` is stored and `ios_base::failbit` is assigned to `err`.

7 Otherwise target sequences are determined "as if" by calling the members `falsename()` and `truename()` of the facet obtained by `use_facet<numpunct<charT>>(str.getloc())`. Successive characters in the range [`in`, `end`) (see 23.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator `in` is compared to `end` only when necessary to obtain a character. If a target sequence is uniquely matched, `val` is set to the corresponding value. Otherwise `false` is stored and `ios_base::failbit` is assigned to `err`.

8 The `in` iterator is always left pointing one position beyond the last character successfully matched. If `val` is set, then `err` is set to `str.goodbit`; or to `str.eofbit` if, when seeking another character to match, it is found that `(in == end)`. If `val` is not set, then `err` is set to `str.failbit`; or to `(str.failbit | str.eofbit)` if the reason for the failure was that `(in == end)`.

[*Example 2*: For targets `true`: `"a"` and `false`: `"abb"`, the input sequence `"a"` yields `val == true` and `err == str.eofbit`; the input sequence `"abc"` yields `err = str.failbit`, with `in` ending at the `'c'` element. For targets `true`: `"1"` and `false`: `"0"`, the input sequence `"1"` yields `val == true` and `err == str.goodbit`. For empty targets `("")`, any input sequence yields `err == str.failbit`. — *end example*]

9 *Returns*: `in`.

28.3.4.3.3 Class template num_put [locale.nm.put]

28.3.4.3.3.1 General [locale.nm.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
  class num_put : public locale::facet {
  public:
    using char_type = charT;
    using iter_type = OutputIterator;

    explicit num_put(size_t refs = 0);

    iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
    iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

    static locale::id id;

  protected:
    ~num_put();
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
    virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
  };
}
```

1 The facet num_put is used to format numeric values to a character sequence such as an ostream.

28.3.4.3.3.2 Members [facet.num.put.members]

```
iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Returns*: do_put(out, str, fill, val).

28.3.4.3.3.3 Virtual functions [facet.num.put.virtuals]

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;
```

1 *Effects*: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

```
locale loc = str.getloc();
```

2 The details of this operation occur in several stages:

(2.1) — Stage 1: Determine a printf conversion specifier `spec` and determine the characters that would be printed by `printf` (31.13) given this conversion specifier for

```
printf(spec, val)
```

assuming that the current locale is the `"C"` locale.

(2.2) — Stage 2: Adjust the representation by converting each `char` determined by stage 1 to a `charT` using a conversion and values returned by members of `use_facet<numpunct<charT>>(loc)`.

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the `out`.

3 Detailed descriptions of each stage follow.

4 *Returns*: `out`.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```
fmtflags flags = str.flags();
fmtflags basefield =  (flags & (ios_base::basefield));
fmtflags uppercase =  (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos =    (flags & (ios_base::showpos));
fmtflags showbase =   (flags & (ios_base::showbase));
fmtflags showpoint =  (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 97.

Table 97 — Integer conversions **[tab:facet.num.put.int]**

State	`stdio` equivalent
`basefield == ios_base::oct`	`%o`
`(basefield == ios_base::hex) && !uppercase`	`%x`
`(basefield == ios_base::hex)`	`%X`
for a `signed` integral type	`%d`
for an `unsigned` integral type	`%u`

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 98.

Table 98 — Floating-point conversions **[tab:facet.num.put.fp]**

State	`stdio` equivalent
`floatfield == ios_base::fixed && !uppercase`	`%f`
`floatfield == ios_base::fixed`	`%F`
`floatfield == ios_base::scientific && !uppercase`	`%e`
`floatfield == ios_base::scientific`	`%E`
`floatfield == (ios_base::fixed | ios_base::scientific) && !uppercase`	`%a`
`floatfield == (ios_base::fixed | ios_base::scientific)`	`%A`
`!uppercase`	`%g`
otherwise	`%G`

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 99.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 100.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.

Table 99 — Length modifier [tab:facet.num.put.length]

Type	Length modifier
`long`	`l`
`long long`	`ll`
`unsigned long`	`l`
`unsigned long long`	`ll`
`long double`	`L`
otherwise	*none*

Table 100 — Numeric conversions [tab:facet.num.put.conv]

Type(s)	State	stdio equivalent
an integral type	`showpos`	`+`
	`showbase`	`#`
a floating-point type	`showpos`	`+`
	`showpoint`	`#`

For conversion from `void*` the specifier is `%p`.

The representations at the end of stage 1 consists of the `char`'s that would be printed by a call of `printf(s, val)` where `s` is the conversion specifier determined above.

Stage 2: Any character `c` other than a decimal point(.) is converted to a `charT` via

```
use_facet<ctype<charT>>(loc).widen(c)
```

A local variable `punct` is initialized via

```
const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);
```

For arithmetic types, `punct.thousands_sep()` characters are inserted into the sequence as determined by the value returned by `punct.do_grouping()` using the method described in 28.3.4.4.1.3.

Decimal point characters(.) are replaced by `punct.decimal_point()`.

Stage 3: A local variable is initialized as

```
fmtflags adjustfield = (flags & (ios_base::adjustfield));
```

The location of any padding[204] is determined according to Table 101.

Table 101 — Fill padding [tab:facet.num.put.fill]

State	Location
`adjustfield == ios_base::left`	pad after
`adjustfield == ios_base::right`	pad before
`adjustfield == internal` and a sign occurs in the representation	pad after the sign
`adjustfield == internal` and representation after stage 1 began with 0x or 0X	pad after x or X
otherwise	pad before

If `str.width()` is nonzero and the number of `charT`'s in the sequence after stage 2 is less than `str.width()`, then enough `fill` characters are added to the sequence at the position indicated for padding to bring the length of the sequence to `str.width()`.

`str.width(0)` is called.

Stage 4: The sequence of `charT`'s at the end of stage 3 are output via

```
*out++ = c
```

204) The conversion specification `#o` generates a leading `0` which is *not* a padding character.

```
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;
```

5 *Returns*: If `(str.flags() & ios_base::boolalpha) == 0` returns `do_put(out, str, fill, (int)val)`, otherwise obtains a string `s` as if by

```
string_type s =
  val ? use_facet<numpunct<charT>>(loc).truename()
      : use_facet<numpunct<charT>>(loc).falsename();
```

and then inserts each character `c` of `s` into `out` via `*out++ = c` and returns `out`.

28.3.4.4 The numeric punctuation facet [facet.numpunct]

28.3.4.4.1 Class template `numpunct` [locale.numpunct]

28.3.4.4.1.1 General [locale.numpunct.general]

```
namespace std {
  template<class charT>
    class numpunct : public locale::facet {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit numpunct(size_t refs = 0);

      char_type   decimal_point() const;
      char_type   thousands_sep() const;
      string      grouping()      const;
      string_type truename()      const;
      string_type falsename()     const;

      static locale::id id;

    protected:
      ~numpunct();                                          // virtual
      virtual char_type   do_decimal_point() const;
      virtual char_type   do_thousands_sep() const;
      virtual string      do_grouping()      const;
      virtual string_type do_truename()      const;         // for bool
      virtual string_type do_falsename()     const;         // for bool
    };
}
```

1 `numpunct<>` specifies numeric punctuation. The specializations required in Table 91 (28.3.3.1.2.1), namely `numpunct<wchar_t>` and `numpunct<char>`, provide classic `"C"` numeric formats, i.e., they contain information equivalent to that contained in the `"C"` locale or their wide character counterparts as if obtained by a call to `widen`.

2 The syntax for number formats is as follows, where *digit* represents the radix set specified by the `fmtflags` argument value, and *thousands-sep* and *decimal-point* are the results of corresponding `numpunct<charT>` members. Integer values have the format:

intval:
  sign$_{opt}$ *units*

sign:
  +
  -

units:
  digits
  digits thousands-sep units

digits:
  digit digits$_{opt}$

and floating-point values have:

floatval:
  sign$_{opt}$ *units fractional*$_{opt}$ *exponent*$_{opt}$
  sign$_{opt}$ *decimal-point digits exponent*$_{opt}$

©ISO/IEC

fractional:
decimal-point digits$_{opt}$

exponent:
e sign$_{opt}$ *digits*

e:
e
E

where the number of digits between *thousands-sep*s is as specified by `do_grouping()`. For parsing, if the *digits* portion contains no thousands-separators, no grouping constraint is applied.

28.3.4.4.1.2 Members [facet.numpunct.members]

```
char_type decimal_point() const;
```

1 *Returns*: `do_decimal_point()`.

```
char_type thousands_sep() const;
```

2 *Returns*: `do_thousands_sep()`.

```
string grouping() const;
```

3 *Returns*: `do_grouping()`.

```
string_type truename()  const;
string_type falsename() const;
```

4 *Returns*: `do_truename()` or `do_falsename()`, respectively.

28.3.4.4.1.3 Virtual functions [facet.numpunct.virtuals]

```
char_type do_decimal_point() const;
```

1 *Returns*: A character for use as the decimal radix separator. The required specializations return `'.'` or `L'.'`.

```
char_type do_thousands_sep() const;
```

2 *Returns*: A character for use as the digit group separator. The required specializations return `','` or `L','`.

```
string do_grouping() const;
```

3 *Returns*: A `string` `vec` used as a vector of integer values, in which each element `vec[i]` represents the number of digits[205] in the group at position `i`, starting with position 0 as the rightmost group. If `vec.size() <= i`, the number is the same as group `(i - 1)`; if `(i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX)`, the size of the digit group is unlimited.

4 The required specializations return the empty string, indicating no grouping.

```
string_type do_truename()  const;
string_type do_falsename() const;
```

5 *Returns*: A string representing the name of the boolean value `true` or `false`, respectively.

6 In the base class implementation these names are `"true"` and `"false"`, or `L"true"` and `L"false"`.

28.3.4.4.2 Class template `numpunct_byname` [locale.numpunct.byname]

```
namespace std {
  template<class charT>
    class numpunct_byname : public numpunct<charT> {
    // this class is specialized for char and wchar_t.
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;
```

205) Thus, the string `"\003"` specifies groups of 3 digits each, and `"3"` probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of `"3"`.

```
    explicit numpunct_byname(const char*, size_t refs = 0);
    explicit numpunct_byname(const string&, size_t refs = 0);

  protected:
    ~numpunct_byname();
  };
}
```

28.3.4.5 The collate category [category.collate]

28.3.4.5.1 Class template collate [locale.collate]

28.3.4.5.1.1 General [locale.collate.general]

```
namespace std {
  template<class charT>
    class collate : public locale::facet {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit collate(size_t refs = 0);

      int compare(const charT* low1, const charT* high1,
                  const charT* low2, const charT* high2) const;
      string_type transform(const charT* low, const charT* high) const;
      long hash(const charT* low, const charT* high) const;

      static locale::id id;

    protected:
      ~collate();
      virtual int do_compare(const charT* low1, const charT* high1,
                             const charT* low2, const charT* high2) const;
      virtual string_type do_transform(const charT* low, const charT* high) const;
      virtual long do_hash (const charT* low, const charT* high) const;
    };
}
```

1 The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 26) and containers operating on strings. The specializations required in Table 91 (28.3.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographical ordering (26.8.11).

2 Each function compares a string of characters `*p` in the range [`low`, `high`).

28.3.4.5.1.2 Members [locale.collate.members]

```
int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;
```

1 *Returns*: `do_compare(low1, high1, low2, high2)`.

```
string_type transform(const charT* low, const charT* high) const;
```

2 *Returns*: `do_transform(low, high)`.

```
long hash(const charT* low, const charT* high) const;
```

3 *Returns*: `do_hash(low, high)`.

28.3.4.5.1.3 Virtual functions [locale.collate.virtuals]

```
int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;
```

1 *Returns*: `1` if the first string is greater than the second, `-1` if less, zero otherwise. The specializations required in Table 91 (28.3.3.1.2.1), namely `collate<char>` and `collate<wchar_t>`, implement a lexicographical comparison (26.8.11).

```
string_type do_transform(const charT* low, const charT* high) const;
```

2 *Returns*: A `basic_string<charT>` value that, compared lexicographically with the result of calling `transform()` on another string, yields the same result as calling `do_compare()` on the same two strings.[206]

```
long do_hash(const charT* low, const charT* high) const;
```

3 *Returns*: An integer value equal to the result of calling `hash()` on any other string for which `do_compare()` returns 0 (equal) when passed the two strings.

4 *Recommended practice*: The probability that the result equals that for another string which does not compare equal should be very small, approaching `(1.0/numeric_limits<unsigned long>::max())`.

28.3.4.5.2 Class template `collate_byname` [locale.collate.byname]

```
namespace std {
  template<class charT>
    class collate_byname : public collate<charT> {
    public:
      using string_type = basic_string<charT>;

      explicit collate_byname(const char*, size_t refs = 0);
      explicit collate_byname(const string&, size_t refs = 0);

    protected:
      ~collate_byname();
    };
}
```

28.3.4.6 The time category [category.time]

28.3.4.6.1 General [category.time.general]

1 Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 28.3.4.6 only apply to the specializations required in Tables 91 and 92 (28.3.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.3.4, and the `ctype<>` facet, to determine formatting details.

28.3.4.6.2 Class template `time_get` [locale.time.get]

28.3.4.6.2.1 General [locale.time.get.general]

```
namespace std {
  class time_base {
  public:
    enum dateorder { no_order, dmy, mdy, ymd, ydm };
  };

  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
    public:
      using char_type = charT;
      using iter_type = InputIterator;

      explicit time_get(size_t refs = 0);

      dateorder date_order() const { return do_date_order(); }
      iter_type get_time(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
      iter_type get_date(iter_type s, iter_type end, ios_base& f,
                         ios_base::iostate& err, tm* t) const;
      iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                            ios_base::iostate& err, tm* t) const;
      iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                              ios_base::iostate& err, tm* t) const;
```

206) This function is useful when one string is being compared to many other strings.

```
    iter_type get_year(iter_type s, iter_type end, ios_base& f,
                       ios_base::iostate& err, tm* t) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
    iter_type get(iter_type s, iter_type end, ios_base& f,
                  ios_base::iostate& err, tm* t, const char_type* fmt,
                  const char_type* fmtend) const;

    static locale::id id;

  protected:
    ~time_get();
    virtual dateorder do_date_order() const;
    virtual iter_type do_get_time(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_date(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base&,
                                     ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base&,
                                       ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get_year(iter_type s, iter_type end, ios_base&,
                                  ios_base::iostate& err, tm* t) const;
    virtual iter_type do_get(iter_type s, iter_type end, ios_base& f,
                             ios_base::iostate& err, tm* t, char format, char modifier) const;
  };
}
```

1 `time_get` is used to parse a character sequence, extracting components of a time or date into a `tm` object. Each `get` member parses a format as produced by a corresponding format specifier to `time_put<>::put`. If the sequence being parsed matches the correct format, the corresponding members of the `tm` argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.[207]

2 If the end iterator is reached during parsing by any of the `get()` member functions, the member sets `ios_base::eofbit` in `err`.

28.3.4.6.2.2 Members [locale.time.get.members]

```
dateorder date_order() const;
```

1 *Returns*: `do_date_order()`.

```
iter_type get_time(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

2 *Returns*: `do_get_time(s, end, str, err, t)`.

```
iter_type get_date(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

3 *Returns*: `do_get_date(s, end, str, err, t)`.

```
iter_type get_weekday(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
```

4 *Returns*: `do_get_weekday(s, end, str, err, t)` or `do_get_monthname(s, end, str, err, t)`.

```
iter_type get_year(iter_type s, iter_type end, ios_base& str,
                   ios_base::iostate& err, tm* t) const;
```

5 *Returns*: `do_get_year(s, end, str, err, t)`.

207) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, char format, char modifier = 0) const;
```

6 *Returns*: `do_get(s, end, f, err, t, format, modifier)`.

```
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
              tm* t, const char_type* fmt, const char_type* fmtend) const;
```

7 *Preconditions*: [`fmt`, `fmtend`) is a valid range.

8 *Effects*: The function starts by evaluating `err = ios_base::goodbit`. It then enters a loop, reading zero or more characters from `s` at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

(8.1) — The expression `fmt == fmtend` evaluates to `true`.

(8.2) — The expression `err == ios_base::goodbit` evaluates to `false`.

(8.3) — The expression `s == end` evaluates to `true`, in which case the function evaluates `err = ios_base::eofbit | ios_base::failbit`.

(8.4) — The next element of `fmt` is equal to `'%'`, optionally followed by a modifier character, followed by a conversion specifier character, `format`, together forming a conversion specification valid for the POSIX function `strptime`. If the number of elements in the range [`fmt`, `fmtend`) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates `err = ios_base::failbit`. Otherwise, the function evaluates `s = do_get(s, end, f, err, t, format, modifier)`, where the value of `modifier` is `'\0'` when the optional modifier is absent from the conversion specification. If `err == ios_base::goodbit` holds after the evaluation of the expression, the function increments `fmt` to point just past the end of the conversion specification and continues looping.

(8.5) — The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments `fmt` until `fmt == fmtend || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances `s` until `s == end || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.

(8.6) — The next character read from `s` matches the element pointed to by `fmt` in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `err = ios_base::failbit`.

9 [*Note 1*: The function uses the `ctype<charT>` facet installed in `f`'s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — *end note*]

10 *Returns*: `s`.

28.3.4.6.2.3 Virtual functions [locale.time.get.virtuals]

```
dateorder do_date_order() const;
```

1 *Returns*: An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.[208] Returns `no_order` if the date format specified by `'x'` contains other variable components (e.g., Julian day, week number, week day).

```
iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

2 *Effects*: Reads characters starting at `s` until it has extracted those `tm` members, and remaining format characters, used by `time_put<>::put` to produce the format specified by `"%H:%M:%S"`, or until it encounters an error or end of sequence.

3 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

```
iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

4 *Effects*: Reads characters starting at `s` until it has extracted those `tm` members and remaining format characters used by `time_put<>::put` to produce one of the following formats, or until it encounters an error. The format depends on the value returned by `date_order()` as shown in Table 102.

208) This function is intended as a convenience only, for common formats, and can return `no_order` in valid locales.

Table 102 — `do_get_date` effects [tab:locale.time.get.dogetdate]

`date_order()`	Format
`no_order`	`"%m%d%y"`
`dmy`	`"%d%m%y"`
`mdy`	`"%m%d%y"`
`ymd`	`"%y%m%d"`
`ydm`	`"%y%d%m"`

5 An implementation may also accept additional implementation-defined formats.

6 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

```
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                         ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                           ios_base::iostate& err, tm* t) const;
```

7 *Effects*: Reads characters starting at `s` until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate `tm` member accordingly.

8 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid name.

```
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

9 *Effects*: Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

10 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

11 *Preconditions*: `t` points to an object.

12 *Effects*: The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `tm` members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function `strptime`, formed by concatenating `'%'`, the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`.

13 For complex conversion specifications such as `%c`, `%x`, or `%X`, or conversion specifications that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `tm` members from the input sequence [`s`, `end`), it evaluates `err |= ios_base::eofbit`. In such cases the values of those `tm` members are unspecified and may be outside their valid range.

14 *Returns*: An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

15 *Remarks*: It is unspecified whether multiple calls to `do_get()` with the address of the same `tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

28.3.4.6.3 Class template `time_get_byname` [locale.time.get.byname]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get_byname : public time_get<charT, InputIterator> {
```

```
    public:
      using dateorder = time_base::dateorder;
      using iter_type = InputIterator;

      explicit time_get_byname(const char*, size_t refs = 0);
      explicit time_get_byname(const string&, size_t refs = 0);

    protected:
      ~time_get_byname();
    };
}
```

28.3.4.6.4 Class template time_put [locale.time.put]

28.3.4.6.4.1 General [locale.time.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit time_put(size_t refs = 0);

      // the following is implemented in terms of other member functions.
      iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                    const charT* pattern, const charT* pat_end) const;
      iter_type put(iter_type s, ios_base& f, char_type fill,
                    const tm* tmb, char format, char modifier = 0) const;

      static locale::id id;

    protected:
      ~time_put();
      virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                               char format, char modifier) const;
    };
}
```

28.3.4.6.4.2 Members [locale.time.put.members]

```
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;
```

1 *Effects*: The first form steps through the sequence from `pattern` to `pat_end`, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to `s` immediately, and each format sequence, as it is identified, results in a call to `do_put`; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character `c` to a `char` value as if by `ct.narrow(c, 0)`, where `ct` is a reference to `ctype<charT>` obtained from `str.getloc()`. The first character of each sequence is equal to `'%'`, followed by an optional modifier character `mod` and a format specifier character `spec` as defined for the function `strftime`. If no modifier character is present, `mod` is zero. For each valid format sequence identified, calls `do_put(s, str, fill, t, spec, mod)`.

2 The second form calls `do_put(s, str, fill, t, format, modifier)`.

3 [*Note 1*: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note*]

4 *Returns*: An iterator pointing immediately after the last character produced.

28.3.4.6.4.3 Virtual functions [locale.time.put.virtuals]

```
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;
```

1 *Effects*: Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

[*Note 1*: Interpretation of the `modifier` argument is implementation-defined. — *end note*]

2 *Returns*: An iterator pointing immediately after the last character produced.

[*Note 2*: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — *end note*]

3 *Recommended practice*: Interpretation of the `modifier` should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

28.3.4.6.5 Class template time_put_byname [locale.time.put.byname]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit time_put_byname(const char*, size_t refs = 0);
      explicit time_put_byname(const string&, size_t refs = 0);

    protected:
      ~time_put_byname();
    };
}
```

28.3.4.7 The monetary category [category.monetary]

28.3.4.7.1 General [category.monetary.general]

1 These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

2 All specifications of member functions for `money_put` and `money_get` in the subclauses of 28.3.4.7 only apply to the specializations required in Tables 91 and 92 (28.3.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 28.3.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

28.3.4.7.2 Class template money_get [locale.money.get]

28.3.4.7.2.1 General [locale.money.get.general]

```
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
    public:
      using char_type   = charT;
      using iter_type   = InputIterator;
      using string_type = basic_string<charT>;

      explicit money_get(size_t refs = 0);

      iter_type get(iter_type s, iter_type end, bool intl,
                    ios_base& f, ios_base::iostate& err,
                    long double& units) const;
```

```
    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  string_type& digits) const;

    static locale::id id;

  protected:
    ~money_get();
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                             ios_base::iostate& err, long double& units) const;
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                             ios_base::iostate& err, string_type& digits) const;
  };
}
```

28.3.4.7.2.2 Members [locale.money.get.members]

```
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;
```

1 *Returns*: `do_get(s, end, intl, f, err, quant)`.

28.3.4.7.2.3 Virtual functions [locale.money.get.virtuals]

```
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;
```

1 *Effects*: Reads characters from `s` to parse and construct a monetary value according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from the locale returned by `str.getloc()`, and `str.flags()`. If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err | str.failbit)`, or `(err | str.failbit | str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `'-'` or in the range from `'0'` through `'9'` (inclusive)) stored in `digits`.

[*Example 1*: The sequence `$1,056.23` in a common United States locale would yield, for `units`, `105623`, or, for `digits`, `"105623"`. — *end example*]

If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

2 Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If `(str.flags() & str.showbase)` is `false`, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

3 If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

[*Example 2*: If `showbase` is off, then for a `neg` value of `"()"` and a currency symbol of `"L"`, in `"(100 L)"` the `"L"` is consumed; but if `neg` is `"-"`, the `"L"` in `"-100 L"` is not consumed. — *end example*]

If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If

the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.

4 Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by[209]

```
for (int i = 0; i < n; ++i)
  buf2[i] = src[find(atoms, atoms + sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

5 *Returns*: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

28.3.4.7.3 Class template `money_put` [locale.money.put]

28.3.4.7.3.1 General [locale.money.put.general]

```
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
    public:
      using char_type   = charT;
      using iter_type   = OutputIterator;
      using string_type = basic_string<charT>;

      explicit money_put(size_t refs = 0);

      iter_type put(iter_type s, bool intl, ios_base& f,
                    char_type fill, long double units) const;
      iter_type put(iter_type s, bool intl, ios_base& f,
                    char_type fill, const string_type& digits) const;

      static locale::id id;

    protected:
      ~money_put();
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                               long double units) const;
      virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
                               const string_type& digits) const;
    };
}
```

28.3.4.7.3.2 Members [locale.money.put.members]

```
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

1 *Returns*: `do_put(s, intl, f, fill, quant)`.

28.3.4.7.3.3 Virtual functions [locale.money.put.virtuals]

```
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
                 char_type fill, const string_type& digits) const;
```

1 *Effects*: Writes characters to `s` according to the format specified by a `moneypunct<charT, Intl>` facet reference `mp` and the character mapping specified by a `ctype<charT>` facet reference `ct` obtained from

209) The semantics here are different from `ct.narrow`.

the locale returned by `str.getloc()`, and `str.flags()`. The argument `units` is transformed into a sequence of wide characters as if by

```
ct.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```

for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('-')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

2 *Returns*: An iterator pointing immediately after the last character produced.

3 *Remarks*: The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is `true`, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is `true`, they are placed after the other characters; otherwise, they are placed before the other characters.

[*Note 1*: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get`. — *end note*]

28.3.4.7.4 Class template `moneypunct` [locale.moneypunct]

28.3.4.7.4.1 General [locale.moneypunct.general]

```
namespace std {
  class money_base {
  public:
    enum part { none, space, symbol, sign, value };
    struct pattern { char field[4]; };
  };

  template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit moneypunct(size_t refs = 0);

      charT       decimal_point() const;
      charT       thousands_sep() const;
      string      grouping()      const;
      string_type curr_symbol()   const;
      string_type positive_sign() const;
      string_type negative_sign() const;
      int         frac_digits()   const;
      pattern     pos_format()    const;
      pattern     neg_format()    const;

      static locale::id id;
      static const bool intl = International;

    protected:
      ~moneypunct();
      virtual charT       do_decimal_point() const;
      virtual charT       do_thousands_sep() const;
      virtual string      do_grouping()      const;
      virtual string_type do_curr_symbol()   const;
      virtual string_type do_positive_sign() const;
      virtual string_type do_negative_sign() const;
      virtual int         do_frac_digits()   const;
```

```
    virtual pattern     do_pos_format()    const;
    virtual pattern     do_neg_format()    const;
  };
}
```

1 The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`th component of the format.[210] In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

2 Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

3 The format of the numeric monetary value is a decimal number:

value:
units fractional$_{opt}$
decimal-point digits

fractional:
decimal-point digits$_{opt}$

if `frac_digits()` returns a positive value, or

value:
units

otherwise. The symbol *decimal-point* indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

units:
digits
digits thousands-sep units

digits:
adigit digits$_{opt}$

In the syntax specification, the symbol *adigit* is any of the values `ct.widen(c)` for `c` in the range `'0'` through `'9'` (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol *thousands-sep* is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

4 The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `numpunct<>::do_grouping()`.

28.3.4.7.4.2 Members [locale.moneypunct.members]

```
charT       decimal_point() const;
charT       thousands_sep() const;
string      grouping()      const;
string_type curr_symbol()   const;
string_type positive_sign() const;
string_type negative_sign() const;
int         frac_digits()   const;
pattern     pos_format()    const;
pattern     neg_format()    const;
```

1 Each of these functions *F* returns the result of calling the corresponding virtual member function `do_`*F*`()`.

210) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

28.3.4.7.4.3 Virtual functions [locale.moneypunct.virtuals]

```
charT do_decimal_point() const;
```

1 *Returns*: The radix separator to use in case `do_frac_digits()` is greater than zero.[211]

```
charT do_thousands_sep() const;
```

2 *Returns*: The digit group separator to use in case `do_grouping()` specifies a digit grouping pattern.[212]

```
string do_grouping() const;
```

3 *Returns*: A pattern defined identically as, but not necessarily equal to, the result of `numpunct<charT>::do_grouping()`.[213]

```
string_type do_curr_symbol() const;
```

4 *Returns*: A string to use as the currency identifier symbol.

[*Note 1*: For specializations where the second template parameter is `true`, this is typically four characters long: a three-letter code as specified by ISO 4217[1] followed by a space. — *end note*]

```
string_type do_positive_sign() const;
string_type do_negative_sign() const;
```

5 *Returns*: `do_positive_sign()` returns the string to use to indicate a positive monetary value;[214] `do_negative_sign()` returns the string to use to indicate a negative value.

```
int do_frac_digits() const;
```

6 *Returns*: The number of digits after the decimal radix separator, if any.[215]

```
pattern do_pos_format() const;
pattern do_neg_format() const;
```

7 *Returns*: The specializations required in Table 92 (28.3.3.1.2.1), namely

(7.1) — `moneypunct<char>`,

(7.2) — `moneypunct<wchar_t>`,

(7.3) — `moneypunct<char, true>`, and

(7.4) — `moneypunct<wchar_t, true>`,

return an object of type `pattern` initialized to `{ symbol, sign, none, value }`.[216]

28.3.4.7.5 Class template moneypunct_byname [locale.moneypunct.byname]

```
namespace std {
  template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
    public:
      using pattern     = money_base::pattern;
      using string_type = basic_string<charT>;

      explicit moneypunct_byname(const char*, size_t refs = 0);
      explicit moneypunct_byname(const string&, size_t refs = 0);

    protected:
      ~moneypunct_byname();
    };
}
```

28.3.4.8 The message retrieval category [category.messages]

28.3.4.8.1 General [category.messages.general]

1 Class `messages<charT>` implements retrieval of strings from message catalogs.

211) In common U.S. locales this is '.'.
212) In common U.S. locales this is ','.
213) To specify grouping by 3s, the value is `"\003"` *not* `"3"`.
214) This is usually the empty string.
215) In common U.S. locales, this is 2.
216) Note that the international symbol returned by `do_curr_symbol()` usually contains a space, itself; for example, `"USD "`.

28.3.4.8.2 Class template messages [locale.messages]

28.3.4.8.2.1 General [locale.messages.general]

```
namespace std {
  class messages_base {
  public:
    using catalog = unspecified signed integer type;
  };

  template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
      using char_type   = charT;
      using string_type = basic_string<charT>;

      explicit messages(size_t refs = 0);

      catalog open(const string& fn, const locale&) const;
      string_type get(catalog c, int set, int msgid,
                      const string_type& dfault) const;
      void close(catalog c) const;

      static locale::id id;

    protected:
      ~messages();
      virtual catalog do_open(const string&, const locale&) const;
      virtual string_type do_get(catalog, int set, int msgid,
                                 const string_type& dfault) const;
      virtual void do_close(catalog) const;
    };
}
```

1 Values of type `messages_base::catalog` usable as arguments to members `get` and `close` can be obtained only by calling member `open`.

28.3.4.8.2.2 Members [locale.messages.members]

```
catalog open(const string& name, const locale& loc) const;
```

1 *Returns*: `do_open(name, loc)`.

```
string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

2 *Returns*: `do_get(cat, set, msgid, dfault)`.

```
void close(catalog cat) const;
```

3 *Effects*: Calls `do_close(cat)`.

28.3.4.8.2.3 Virtual functions [locale.messages.virtuals]

```
catalog do_open(const string& name, const locale& loc) const;
```

1 *Returns*: A value that may be passed to `get()` to retrieve a message from the message catalog identified by the string `name` according to an implementation-defined mapping. The result can be used until it is passed to `close()`.

2 Returns a value less than 0 if no such catalog can be opened.

3 *Remarks*: The locale argument `loc` is used for character set code conversion when retrieving messages, if needed.

```
string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
```

4 *Preconditions*: `cat` is a catalog obtained from `open()` and not yet closed.

5 *Returns*: A message identified by arguments `set`, `msgid`, and `dfault`, according to an implementation-defined mapping. If no such message can be found, returns `dfault`.

```
void do_close(catalog cat) const;
```

6 *Preconditions*: `cat` is a catalog obtained from `open()` and not yet closed.

7 *Effects*: Releases unspecified resources associated with `cat`.

8 *Remarks*: The limit on such resources, if any, is implementation-defined.

28.3.4.8.3 Class template `messages_byname` [locale.messages.byname]

```
namespace std {
  template<class charT>
    class messages_byname : public messages<charT> {
    public:
      using catalog     = messages_base::catalog;
      using string_type = basic_string<charT>;

      explicit messages_byname(const char*, size_t refs = 0);
      explicit messages_byname(const string&, size_t refs = 0);

    protected:
      ~messages_byname();
    };
}
```

28.3.5 C library locales [c.locales]

28.3.5.1 Header `<clocale>` synopsis [clocale.syn]

```
namespace std {
  struct lconv;

  char* setlocale(int category, const char* locale);
  lconv* localeconv();
}

#define NULL see 17.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below
```

1 The contents and meaning of the header `<clocale>` are the same as the C standard library header `<locale.h>`.

28.3.5.2 Data races [clocale.data.races]

1 Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 103.

See also: ISO/IEC 9899:2024, 7.11

Table 103 — Potential `setlocale` data races [tab:setlocale.data.races]

fprintf	isprint	iswdigit	localeconv	tolower
fscanf	ispunct	iswgraph	mblen	toupper
isalnum	isspace	iswlower	mbstowcs	towlower
isalpha	isupper	iswprint	mbtowc	towupper
isblank	iswalnum	iswpunct	setlocale	wcscoll
iscntrl	iswalpha	iswspace	strcoll	wcstod
isdigit	iswblank	iswupper	strerror	wcstombs
isgraph	iswcntrl	iswxdigit	strtod	wcsxfrm
islower	iswctype	isxdigit	strxfrm	wctomb

28.4 Text encodings identification [text.encoding]

28.4.1 Header <text_encoding> synopsis [text.encoding.syn]

```
namespace std {
  struct text_encoding;

  // 28.4.2.7, hash support
  template<class T> struct hash;
  template<> struct hash<text_encoding>;
}
```

28.4.2 Class text_encoding [text.encoding.class]

28.4.2.1 Overview [text.encoding.overview]

1 The class text_encoding describes an interface for accessing the IANA Character Sets registry[9].

```
namespace std {
  struct text_encoding {
    static constexpr size_t max_name_length = 63;

    // 28.4.2.6, enumeration text_encoding::id
    enum class id : int_least32_t {
      see below
    };
    using enum id;

    constexpr text_encoding() = default;
    constexpr explicit text_encoding(string_view enc) noexcept;
    constexpr text_encoding(id i) noexcept;

    constexpr id mib() const noexcept;
    constexpr const char* name() const noexcept;

    // 28.4.2.5, class text_encoding::aliases_view
    struct aliases_view;
    constexpr aliases_view aliases() const noexcept;

    friend constexpr bool operator==(const text_encoding& a,
                                     const text_encoding& b) noexcept;
    friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;

    static consteval text_encoding literal() noexcept;
    static text_encoding environment();
    template<id i> static bool environment_is();

  private:
    id mib_ = id::unknown;                                          // exposition only
    char name_[max_name_length + 1] = {0};                          // exposition only
    static constexpr bool comp-name(string_view a, string_view b);  // exposition only
  };
}
```

2 Class text_encoding is a trivially copyable type (6.9.1).

28.4.2.2 General [text.encoding.general]

1 A *registered character encoding* is a character encoding scheme in the IANA Character Sets registry.

[*Note 1*: The IANA Character Sets registry uses the term "character sets" to refer to character encodings. — *end note*]

The primary name of a registered character encoding is the name of that encoding specified in the IANA Character Sets registry.

2 The set of known registered character encodings contains every registered character encoding specified in the IANA Character Sets registry except for the following:

(2.1) — NATS-DANO (33)

(2.2) — NATS-DANO-ADD (34)

3 Each known registered character encoding is identified by an enumerator in `text_encoding::id`, and has a set of zero or more *aliases*.

4 The set of aliases of a known registered character encoding is an implementation-defined superset of the aliases specified in the IANA Character Sets registry. The set of aliases for US-ASCII includes "ASCII". No two aliases or primary names of distinct registered character encodings are equivalent when compared by `text_encoding::`*`comp-name`*`.`

5 How a `text_encoding` object is determined to be representative of a character encoding scheme implemented in the translation or execution environment is implementation-defined.

6 An object `e` of type `text_encoding` such that `e.mib() == text_encoding::id::unknown` is `false` and `e.mib() == text_encoding::id::other` is `false` maintains the following invariants:

(6.1) — `*e.name() == '\0'` is `false`, and

(6.2) — `e.mib() == text_encoding(e.name()).mib()` is `true`.

7 *Recommended practice*:

(7.1) — Implementations should not consider registered encodings to be interchangeable.

[*Example 1*: Shift_JIS and Windows-31J denote different encodings. — *end example*]

(7.2) — Implementations should not use the name of a registered encoding to describe another similar yet different non-registered encoding unless there is a precedent on that implementation.

[*Example 2*: Big5 — *end example*]

28.4.2.3 Members [text.encoding.members]

```
constexpr explicit text_encoding(string_view enc) noexcept;
```

1 *Preconditions*:

(1.1) — `enc` represents a string in the ordinary literal encoding consisting only of elements of the basic character set (5.3.1).

(1.2) — `enc.size() <= max_name_length` is `true`.

(1.3) — `enc.contains('\0')` is `false`.

2 *Postconditions*:

(2.1) — If there exists a primary name or alias `a` of a known registered character encoding such that *`comp-name`*`(a, enc)` is `true`, *`mib_`* has the value of the enumerator of `id` associated with that registered character encoding. Otherwise, *`mib_`* `== id::other` is `true`.

(2.2) — `enc.compare(`*`name_`*`) == 0` is `true`.

```
constexpr text_encoding(id i) noexcept;
```

3 *Preconditions*: `i` has the value of one of the enumerators of `id`.

4 *Postconditions*:

(4.1) — *`mib_`* `== i` is `true`.

(4.2) — If `(`*`mib_`* `== id::unknown || `*`mib_`* `== id::other)` is `true`, `strlen(`*`name_`*`) == 0` is `true`. Otherwise, `ranges::contains(aliases(), string_view(`*`name_`*`))` is `true`.

```
constexpr id mib() const noexcept;
```

5 *Returns*: *`mib_`*.

```
constexpr const char* name() const noexcept;
```

6 *Returns*: *`name_`*.

7 *Remarks*: `name()` is an NTBS and accessing elements of *`name_`* outside of the range `name()` + [0, `strlen(name()) + 1`) is undefined behavior.

```
constexpr aliases_view aliases() const noexcept;
```

Let `r` denote an instance of `aliases_view`. If `*this` represents a known registered character encoding, then:

(7.1) — `r.front()` is the primary name of the registered character encoding,

(7.2) — `r` contains the aliases of the registered character encoding, and

(7.3) — `r` does not contain duplicate values when compared with `strcmp`.

Otherwise, `r` is an empty range.

8 Each element in `r` is a non-null, non-empty NTBS encoded in the literal character encoding and comprising only characters from the basic character set.

9 *Returns*: `r`.

10 [*Note 1*: The order of aliases in `r` is unspecified. — *end note*]

```
static consteval text_encoding literal() noexcept;
```

11 *Mandates*: `CHAR_BIT == 8` is `true`.

12 *Returns*: A `text_encoding` object representing the ordinary character literal encoding (5.3.1).

```
static text_encoding environment();
```

13 *Mandates*: `CHAR_BIT == 8` is `true`.

14 *Returns*: A `text_encoding` object representing the implementation-defined character encoding scheme of the environment. On a POSIX implementation, this is the encoding scheme associated with the POSIX locale denoted by the empty string `""`.

15 [*Note 2*: This function is not affected by calls to `setlocale`. — *end note*]

16 *Recommended practice*: Implementations should return a value that is not affected by calls to the POSIX function `setenv` and other functions which can modify the environment (17.14).

```
template<id i>
  static bool environment_is();
```

17 *Mandates*: `CHAR_BIT == 8` is `true`.

18 *Returns*: `environment() == i`.

```
static constexpr bool comp-name(string_view a, string_view b);
```

19 *Returns*: `true` if the two strings `a` and `b` encoded in the ordinary literal encoding are equal, ignoring, from left-to-right,

(19.1) — all elements that are not digits or letters (16.3.3.3.4.1),

(19.2) — character case, and

(19.3) — any sequence of one or more `0` characters not immediately preceded by a numeric prefix, where a numeric prefix is a sequence consisting of a digit in the range `[1, 9]` optionally followed by one or more elements which are not digits or letters,

and `false` otherwise.

[*Note 3*: This comparison is identical to the "Charset Alias Matching" algorithm described in the Unicode Technical Standard 22[11]. — *end note*]

[*Example 1*:

```
static_assert(comp-name("UTF-8", "utf8") == true);
static_assert(comp-name("u.t.f-008", "utf8") == true);
static_assert(comp-name("ut8", "utf8") == false);
static_assert(comp-name("utf-80", "utf8") == false);
```

— *end example*]

28.4.2.4 Comparison functions [text.encoding.cmp]

```
friend constexpr bool operator==(const text_encoding& a, const text_encoding& b) noexcept;
```

1 *Returns*: If `a.mib_ == id::other && b.mib_ == id::other` is `true`, then *comp-name*`(a.name_, b.name_)`. Otherwise, `a.mib_ == b.mib_`.

```
friend constexpr bool operator==(const text_encoding& encoding, id i) noexcept;
```

2 *Returns*: `encoding.mib_ == i`.

3 *Remarks*: This operator induces an equivalence relation on its arguments if and only if `i != id::other` is `true`.

28.4.2.5 Class `text_encoding::aliases_view` [text.encoding.aliases]

```
struct text_encoding::aliases_view : ranges::view_interface<text_encoding::aliases_view> {
  constexpr implementation-defined begin() const;
  constexpr implementation-defined end() const;
};
```

1 `text_encoding::aliases_view` models `copyable`, `ranges::view`, `ranges::random_access_range`, and `ranges::borrowed_range`.

[*Note 1*: `text_encoding::aliases_view` is not required to satisfy `ranges::common_range`, nor `default_initializable`. — *end note*]

2 Both `ranges::range_value_t<text_encoding::aliases_view>` and `ranges::range_reference_t<text_encoding::aliases_view>` denote `const char*`.

3 `ranges::iterator_t<text_encoding::aliases_view>` is a constexpr iterator (24.3.1).

28.4.2.6 Enumeration `text_encoding::id` [text.encoding.id]

```
namespace std {
  enum class text_encoding::id : int_least32_t {
    other = 1,

  };
}
```

[*Note 1*: The `text_encoding::id` enumeration contains an enumerator for each known registered character encoding. For each encoding, the corresponding enumerator is derived from the alias beginning with "`cs`", as follows:

— `csUnicode` is mapped to `text_encoding::id::UCS2`,

— `csIBBM904` is mapped to `text_encoding::id::IBM904`, and

— the "`cs`" prefix is removed from other names.

— *end note*]

28.4.2.7 Hash support [text.encoding.hash]

```
template<> struct hash<text_encoding>;
```

1 The specialization is enabled (22.10.19).

28.5 Formatting [format]

28.5.1 Header <format> synopsis [format.syn]

```
namespace std {
  // 28.5.6.7, class template basic_format_context
  template<class Out, class charT> class basic_format_context;
  using format_context = basic_format_context<unspecified, char>;
  using wformat_context = basic_format_context<unspecified, wchar_t>;

  // 28.5.8.3, class template basic_format_args
  template<class Context> class basic_format_args;
  using format_args = basic_format_args<format_context>;
  using wformat_args = basic_format_args<wformat_context>;

  // 28.5.4, class template basic_format_string
  template<class charT, class... Args>
    struct basic_format_string;

  template<class charT> struct dynamic-format-string {                    // exposition only
  private:
    basic_string_view<charT> str;                                         // exposition only
  public:
    constexpr dynamic-format-string(basic_string_view<charT> s) noexcept : str(s) {}
    dynamic-format-string(const dynamic-format-string&) = delete;
```

```

1 The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

28.5.2 Format string [format.string]

28.5.2.1 General [format.string.general]

1 A *format string* for arguments `args` is a (possibly empty) sequence of *replacement fields*, *escape sequences*, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{{` or `}}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:
    { *arg-id*$_{opt}$ *format-specifier*$_{opt}$ }

arg-id:
    0
    positive-integer

positive-integer:
    nonzero-digit
    positive-integer digit

nonnegative-integer:
    digit
    nonnegative-integer digit

nonzero-digit: one of
    1 2 3 4 5 6 7 8 9

digit: one of
    0 1 2 3 4 5 6 7 8 9

format-specifier:
    : *format-spec*

format-spec:
    as specified by the `formatter` specialization for the argument type; cannot start with `}`

2 The *arg-id* field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index *arg-id* in `args`, the

string is not a format string for `args`. The optional *format-specifier* field explicitly specifies a format for the replacement value.

3 [*Example 1*:

```
string s = format("{0}-{{", 8);          // value of s is "8-{"
```

— *end example*]

4 If all *arg-id*s in a format string are omitted (including those in the *format-spec*, as interpreted by the corresponding `formatter` specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some *arg-id*s are omitted and some are present, the string is not a format string.

[*Note 1*: A format string cannot contain a mixture of automatic and manual indexing. — *end note*]

[*Example 2*:

```
string s0 = format("{} to {}",   "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed
string s3 = format("{} to {1}",  "a", "b"); // not a format string (mixing automatic and manual indexing),
                                            // ill-formed
```

— *end example*]

5 The *format-spec* field contains *format specifications* that define how the value should be presented. Each type can define its own interpretation of the *format-spec* field. If *format-spec* does not conform to the format specifications for the argument type referred to by *arg-id*, the string is not a format string for `args`.

[*Example 3*:

(5.1) — For arithmetic, pointer, and string types the *format-spec* is interpreted as a *std-format-spec* as described in 28.5.2.2.

(5.2) — For chrono types the *format-spec* is interpreted as a *chrono-format-spec* as described in 30.12.

(5.3) — For user-defined `formatter` specializations, the behavior of the `parse` member function determines how the *format-spec* is interpreted.

— *end example*]

28.5.2.2 Standard format specifiers [format.string.std]

1 Each `formatter` specialization described in 28.5.6.4 for fundamental and string types interprets *format-spec* as a *std-format-spec*.

[*Note 1*: The format specification can be used to specify such details as minimum field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — *end note*]

The syntax of format specifications is as follows:

std-format-spec:
fill-and-align$_{opt}$ *sign*$_{opt}$ `#`$_{opt}$ `0`$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ `L`$_{opt}$ *type*$_{opt}$

fill-and-align:
fill$_{opt}$ *align*

fill:
any character other than `{` or `}`

align: one of
`<` `>` `^`

sign: one of
`+` `-` space

width:
positive-integer
`{` *arg-id*$_{opt}$ `}`

precision:
`.` *nonnegative-integer*
`.` `{` *arg-id*$_{opt}$ `}`

type: one of
`a` `A` `b` `B` `c` `d` `e` `E` `f` `F` `g` `G` `o` `p` `P` `s` `x` `X` `?`

©ISO/IEC

2 Field widths are specified in *field width units*; the number of column positions required to display a sequence of characters in a terminal. The *minimum field width* is the number of field width units a replacement field minimally requires of the formatted sequence of characters produced for a format argument. The *estimated field width* is the number of field width units that are required for the formatted sequence of characters produced for a format argument independent of the effects of the *width* option. The *padding width* is the greater of `0` and the difference of the minimum field width and the estimated field width.

[*Note 2*: The POSIX `wcswidth` function is an example of a function that, given a string, returns the number of column positions required by a terminal to display the string. — *end note*]

3 The *fill character* is the character denoted by the *fill* option or, if the *fill* option is absent, the space character. For a format specification in UTF-8, UTF-16, or UTF-32, the fill character corresponds to a single Unicode scalar value.

[*Note 3*: The presence of a *fill* option is signaled by the character following it, which must be one of the alignment options. If the second character of *std-format-spec* is not a valid alignment option, then it is assumed that the *fill* and *align* options are both absent. — *end note*]

4 The *align* option applies to all argument types. The meaning of the various alignment options is as specified in Table 104.

[*Example 1*:

```
char c = 120;
string s0 = format("{:6}", 42);              // value of s0 is "    42"
string s1 = format("{:6}", 'x');             // value of s1 is "x     "
string s2 = format("{:*<6}", 'x');           // value of s2 is "x*****"
string s3 = format("{:*>6}", 'x');           // value of s3 is "*****x"
string s4 = format("{:*^6}", 'x');           // value of s4 is "**x***"
string s5 = format("{:6d}", c);              // value of s5 is "   120"
string s6 = format("{:6}", true);            // value of s6 is "true  "
string s7 = format("{:*<6.3}", "123456");    // value of s7 is "123***"
string s8 = format("{:02}", 1234);           // value of s8 is "1234"
string s9 = format("{:*<}", "12");           // value of s9 is "12"
string sA = format("{:*<6}", "12345678");    // value of sA is "12345678"
string sB = format("{:🤡^6}", "x");          // value of sB is "🤡🤡x🤡🤡🤡"
string sC = format("{:*^6}", "🤡🤡🤡");      // value of sC is "🤡🤡🤡"
```

— *end example*]

[*Note 4*: The *fill*, *align*, and `0` options have no effect when the minimum field width is not greater than the estimated field width because padding width is `0` in that case. Since fill characters are assumed to have a field width of `1`, use of a character with a different field width can produce misaligned output. The 🤡 (U+1F921 CLOWN FACE) character has a field width of `2`. The examples above that include that character illustrate the effect of the field width when that character is used as a fill character as opposed to when it is used as a formatting argument. — *end note*]

Table 104 — Meaning of *align* options [tab:format.align]

Option	Meaning
`<`	Forces the formatted argument to be aligned to the start of the field by inserting n fill characters after the formatted argument where n is the padding width. This is the default for non-arithmetic non-pointer types, `charT`, and `bool`, unless an integer presentation type is specified.
`>`	Forces the formatted argument to be aligned to the end of the field by inserting n fill characters before the formatted argument where n is the padding width. This is the default for arithmetic types other than `charT` and `bool`, pointer types, or when an integer presentation type is specified.
`^`	Forces the formatted argument to be centered within the field by inserting $\lfloor \frac{n}{2} \rfloor$ fill characters before and $\lceil \frac{n}{2} \rceil$ fill characters after the formatted argument, where n is the padding width.

5 The *sign* option is only valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified. The meaning of the various options is as specified in Table 105.

6 The *sign* option applies to floating-point infinity and NaN.

Table 105 — Meaning of *sign* options [tab:format.sign]

Option	Meaning
`+`	Indicates that a sign should be used for both non-negative and negative numbers. The `+` sign is inserted before the output of `to_chars` for non-negative numbers other than negative zero. [*Note 5*: For negative numbers and negative zero the output of `to_chars` will already contain the sign so no additional transformation is performed. — *end note*]
`-`	Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).
space	Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.

[*Example 2*:

```
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);        // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);       // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);      // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);      // value of s3 is "nan,+nan,nan, nan"
```

— *end example*]

7 The `#` option causes the *alternate form* to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 107 into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for `g` and `G` conversions, trailing zeros are not removed from the result.

8 The `0` option is valid for arithmetic types other than `charT` and `bool`, pointer types, or when an integer presentation type is specified. For formatting arguments that have a value other than an infinity or a NaN, this option pads the formatted argument by inserting the `0` character n times following the sign or base prefix indicators (if any) where n is `0` if the *align* option is present and is the padding width otherwise.

[*Example 3*:

```
char c = 120;
string s1 = format("{:+06d}", c);       // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa);     // value of s2 is "0x000a"
string s3 = format("{:<06}", -42);      // value of s3 is "-42    " (0 has no effect)
string s4 = format("{:06}", inf);       // value of s4 is "   inf" (0 has no effect)
```

— *end example*]

9 The *width* option specifies the minimum field width. If the *width* option is absent, the minimum field width is `0`.

10 If `{` *arg-id*$_{opt}$ `}` is used in a *width* or *precision* option, the value of the corresponding formatting argument is used as the value of the option. The option is valid only if the corresponding formatting argument is of standard signed or unsigned integer type. If its value is negative, an exception of type `format_error` is thrown.

11 If *positive-integer* is used in a *width* option, the value of the *positive-integer* is interpreted as a decimal integer and used as the value of the option.

12 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use either UTF-8, UTF-16, or UTF-32, on platforms capable of displaying Unicode text in a terminal.

[*Note 6*: This is the case for Windows®-based[217] and many POSIX-based operating systems. — *end note*]

13 For a sequence of characters in UTF-8, UTF-16, or UTF-32, an implementation should use as its field width the sum of the field widths of the first code point of each extended grapheme cluster. Extended grapheme clusters are defined by UAX #29 of the Unicode Standard. The following code points have a field width of 2:

(13.1) — any code point with the `East_Asian_Width="W"` or `East_Asian_Width="F"` property as described by UAX #44 of the Unicode Standard

(13.2) — U+4DC0 – U+4DFF (Yijing Hexagram Symbols)

(13.3) — U+1F300 – U+1F5FF (Miscellaneous Symbols and Pictographs)

(13.4) — U+1F900 – U+1F9FF (Supplemental Symbols and Pictographs)

The field width of all other code points is 1.

14 For a sequence of characters in neither UTF-8, UTF-16, nor UTF-32, the field width is unspecified.

15 The *precision* option is valid for floating-point and string types. For floating-point types, the value of this option specifies the precision to be used for the floating-point presentation type. For string types, this option specifies the longest prefix of the formatted argument to be included in the replacement field such that the field width of the prefix is no greater than the value of this option.

16 If *nonnegative-integer* is used in a *precision* option, the value of the decimal integer is used as the value of the option.

17 When the `L` option is used, the form used for the conversion is called the *locale-specific form*. The `L` option is only valid for arithmetic types, and its effect depends upon the type. A call to `format` on a given formatter specialization is not a constant subexpression if the locale-specific form is specified.

(17.1) — For integral types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group separator characters as if obtained with `numpunct<charT>::grouping` and `numpunct<charT>::thousands_sep`.

(17.2) — For floating-point types, the locale-specific form causes the context's locale to be used to insert the appropriate digit group and radix separator characters as if obtained with `numpunct<charT>::grouping`, `numpunct<charT>::thousands_sep`, and `numpunct<charT>::decimal_point`.

(17.3) — For the textual representation of `bool`, the locale-specific form causes the context's locale to be used to insert the appropriate string as if obtained with `numpunct<charT>::truename` or `numpunct<charT>::falsename`.

If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding.

18 The *type* determines how the data should be presented.

19 The available string presentation types are specified in Table 106.

Table 106 — Meaning of *type* options for strings [tab:format.type.string]

Type	Meaning
none, `s`	Copies the string to the output.
`?`	Copies the escaped string (28.5.6.5) to the output.

20 The meaning of some non-string presentation types is defined in terms of a call to `to_chars`. In such cases, let [`first`, `last`) be a range large enough to hold the `to_chars` output and `value` be the formatting argument value. Formatting is done as if by calling `to_chars` as specified, transcoding the `to_chars` output to the wide literal encoding if `charT` is `wchar_t`, and copying the output through the output iterator of the format context.

[*Note 7*: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — *end note*]

217) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.

21 The available integer presentation types for integral types other than `bool` and `charT` are specified in Table 107.

[*Example 4*:

```
string s0 = format("{}", 42);                          // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42);     // value of s1 is "101010 42 52 2a"
string s2 = format("{0:#x} {0:#X}", 42);               // value of s2 is "0x2a 0X2A"
string s3 = format("{:L}", 1234);                      // value of s3 can be "1,234"
                                                       // (depending on the locale)
```

— *end example*]

Table 107 — Meaning of *type* options for integer types [tab:format.type.int]

Type	Meaning
`b`	`to_chars(first, last, value, 2)`; the base prefix is `0b`.
`B`	The same as `b`, except that the base prefix is `0B`.
`c`	Copies the character `static_cast<charT>(value)` to the output. Throws `format_error` if `value` is not in the range of representable values for `charT`.
`d`	`to_chars(first, last, value)`.
`o`	`to_chars(first, last, value, 8)`; the base prefix is `0` if `value` is nonzero and is empty otherwise.
`x`	`to_chars(first, last, value, 16)`; the base prefix is `0x`.
`X`	The same as `x`, except that it uses uppercase letters for digits above 9 and the base prefix is `0X`.
none	The same as `d`. [*Note 8*: If the formatting argument type is `charT` or `bool`, the default is instead `c` or `s`, respectively. — *end note*]

22 The available `charT` presentation types are specified in Table 108.

Table 108 — Meaning of *type* options for `charT` [tab:format.type.char]

Type	Meaning
none, `c`	Copies the character to the output.
`b`, `B`, `d`, `o`, `x`, `X`	As specified in Table 107 with `value` converted to the unsigned version of the underlying type.
`?`	Copies the escaped character (28.5.6.5) to the output.

23 The available `bool` presentation types are specified in Table 109.

Table 109 — Meaning of *type* options for `bool` [tab:format.type.bool]

Type	Meaning
none, `s`	Copies textual representation, either `true` or `false`, to the output.
`b`, `B`, `d`, `o`, `x`, `X`	As specified in Table 107 for the value `static_cast<unsigned char>(value)`.

24 The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 110. For lower-case presentation types, infinity and NaN are formatted as `inf` and `nan`, respectively. For upper-case presentation types, infinity and NaN are formatted as `INF` and `NAN`, respectively.

[*Note 9*: In either case, a sign is included if indicated by the *sign* option. — *end note*]

25 The available pointer presentation types and their mapping to `to_chars` are specified in Table 111.

[*Note 10*: Pointer presentation types also apply to `nullptr_t`. — *end note*]

Table 110 — Meaning of *type* options for floating-point types [tab:format.type.float]

Type	Meaning
`a`	If *precision* is specified, equivalent to `to_chars(first, last, value, chars_format::hex, precision)` where `precision` is the specified formatting precision; equivalent to `to_chars(first, last, value, chars_format::hex)` otherwise.
`A`	The same as `a`, except that it uses uppercase letters for digits above 9 and `P` to indicate the exponent.
`e`	Equivalent to `to_chars(first, last, value, chars_format::scientific, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`E`	The same as `e`, except that it uses `E` to indicate exponent.
`f`, `F`	Equivalent to `to_chars(first, last, value, chars_format::fixed, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`g`	Equivalent to `to_chars(first, last, value, chars_format::general, precision)` where `precision` is the specified formatting precision, or `6` if *precision* is not specified.
`G`	The same as `g`, except that it uses `E` to indicate exponent.
none	If *precision* is specified, equivalent to `to_chars(first, last, value, chars_format::general, precision)` where `precision` is the specified formatting precision; equivalent to `to_chars(first, last, value)` otherwise.

Table 111 — Meaning of *type* options for pointer types [tab:format.type.ptr]

Type	Meaning
none, `p`	If `uintptr_t` is declared, `to_chars(first, last, reinterpret_cast<uintptr_t>(value), 16)` with the prefix `0x` inserted immediately before the output of `to_chars`; otherwise, implementation-defined.
`P`	The same as `p`, except that it uses uppercase letters for digits above `9` and the base prefix is `0X`.

28.5.3 Error reporting [format.err.report]

[1] Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.14.

28.5.4 Class template `basic_format_string` [format.fmt.string]

```
namespace std {
  template<class charT, class... Args>
  struct basic_format_string {
  private:
    basic_string_view<charT> str;          // exposition only

  public:
    template<class T> consteval basic_format_string(const T& s);
    constexpr basic_format_string(dynamic-format-string<charT> s) noexcept : str(s.str) {}

    constexpr basic_string_view<charT> get() const noexcept { return str; }
  };
}
```

```
template<class T> consteval basic_format_string(const T& s);
```

1 *Constraints*: `const T&` models `convertible_to<basic_string_view<charT>>`.

2 *Effects*: Direct-non-list-initializes *`str`* with `s`.

3 *Remarks*: A call to this function is not a core constant expression (7.7.2) unless there exist `args` of types `Args` such that *`str`* is a format string for `args`.

28.5.5 Formatting functions [format.functions]

1 A call to any of the functions defined in this subclause is a constant subexpression only if each of the used `formatter` specializations is a constexpr-enabled specialization (28.5.6.4).

2 In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 26.2.

```
template<class... Args>
  constexpr string format(format_string<Args...> fmt, Args&&... args);
```

3 *Effects*: Equivalent to:

```
return vformat(fmt.str, make_format_args(args...));
```

```
template<class... Args>
  constexpr wstring format(wformat_string<Args...> fmt, Args&&... args);
```

4 *Effects*: Equivalent to:

```
return vformat(fmt.str, make_wformat_args(args...));
```

```
template<class... Args>
  string format(const locale& loc, format_string<Args...> fmt, Args&&... args);
```

5 *Effects*: Equivalent to:

```
return vformat(loc, fmt.str, make_format_args(args...));
```

```
template<class... Args>
  wstring format(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

6 *Effects*: Equivalent to:

```
return vformat(loc, fmt.str, make_wformat_args(args...));
```

```
constexpr string vformat(string_view fmt, format_args args);
constexpr wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

7 *Returns*: A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

8 *Throws*: As specified in 28.5.3.

```
template<class Out, class... Args>
  constexpr Out format_to(Out out, format_string<Args...> fmt, Args&&... args);
```

9 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
  constexpr Out format_to(Out out, wformat_string<Args...> fmt, Args&&... args);
```

10 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, format_string<Args...>  fmt, Args&&... args);
```

11 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));
```

```
template<class Out, class... Args>
  Out format_to(Out out, const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

12 *Effects*: Equivalent to:

```
return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));
```

```
template<class Out>
  constexpr Out vformat_to(Out out, string_view fmt, format_args args);
template<class Out>
  constexpr Out vformat_to(Out out, wstring_view fmt, wformat_args args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, string_view fmt, format_args args);
template<class Out>
  Out vformat_to(Out out, const locale& loc, wstring_view fmt, wformat_args args);
```

13 Let `charT` be `decltype(fmt)::value_type`.

14 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

15 *Preconditions*: `Out` models `output_iterator<const charT&>`.

16 *Effects*: Places the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range $[$`out`, `out + N`$)$, where `N` is the number of characters in that character representation. If present, `loc` is used for locale-specific formatting.

17 *Returns*: `out + N`.

18 *Throws*: As specified in 28.5.3.

```
template<class Out, class... Args>
  constexpr format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                                format_string<Args...> fmt,
                                                Args&&... args);
template<class Out, class... Args>
  constexpr format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                                wformat_string<Args...> fmt,
                                                Args&&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, format_string<Args...> fmt,
                                      Args&&... args);
template<class Out, class... Args>
  format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n,
                                      const locale& loc, wformat_string<Args...> fmt,
                                      Args&&... args);
```

19 Let

(19.1) — `charT` be `decltype(fmt.str)::value_type`,

(19.2) — `N` be `formatted_size(fmt, args...)` for the functions without a `loc` parameter and `formatted_size(loc, fmt, args...)` for the functions with a `loc` parameter, and

(19.3) — `M` be `clamp(n, 0, N)`.

20 *Constraints*: `Out` satisfies `output_iterator<const charT&>`.

21 *Preconditions*: `Out` models `output_iterator<const charT&>`, and `formatter<remove_cvref_t<`T_i`>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) for each T_i in `Args`.

22 *Effects*: Places the first `M` characters of the character representation of formatting the arguments provided by `args`, formatted according to the specifications given in `fmt`, into the range $[$`out`, `out + M`$)$. If present, `loc` is used for locale-specific formatting.

23 *Returns*: `{out + M, N}`.

24 *Throws*: As specified in 28.5.3.

```
template<class... Args>
  constexpr size_t formatted_size(format_string<Args...> fmt, Args&&... args);
template<class... Args>
  constexpr size_t formatted_size(wformat_string<Args...> fmt, Args&&... args);
```

©ISO/IEC

```
template<class... Args>
  size_t formatted_size(const locale& loc, format_string<Args...> fmt, Args&&... args);
template<class... Args>
  size_t formatted_size(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

25 Let `charT` be `decltype(fmt.`*`str`*`)::value_type`.

26 *Preconditions*: `formatter<remove_cvref_t<`T_i`>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) for each T_i in `Args`.

27 *Returns*: The number of characters in the character representation of formatting arguments `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.

28 *Throws*: As specified in 28.5.3.

28.5.6 Formatter [format.formatter]

28.5.6.1 Formatter requirements [formatter.requirements]

1 A type `F` meets the *BasicFormatter* requirements if it meets the

(1.1) — *Cpp17DefaultConstructible* (Table 30),

(1.2) — *Cpp17CopyConstructible* (Table 32),

(1.3) — *Cpp17CopyAssignable* (Table 34),

(1.4) — *Cpp17Swappable* (16.4.4.3), and

(1.5) — *Cpp17Destructible* (Table 35)

requirements, and the expressions shown in Table 112 are valid and have the indicated semantics.

2 A type `F` meets the *Formatter* requirements if it meets the *BasicFormatter* requirements and the expressions shown in Table 113 are valid and have the indicated semantics.

3 Given character type `charT`, output iterator type `Out`, and formatting argument type `T`, in Table 112 and Table 113:

(3.1) — `f` is a value of type (possibly const) `F`,

(3.2) — `g` is an lvalue of type `F`,

(3.3) — `u` is an lvalue of type `T`,

(3.4) — `t` is a value of a type convertible to (possibly const) `T`,

(3.5) — `PC` is `basic_format_parse_context<charT>`,

(3.6) — `FC` is `basic_format_context<Out, charT>`,

(3.7) — `pc` is an lvalue of type `PC`, and

(3.8) — `fc` is an lvalue of type `FC`.

`pc.begin()` points to the beginning of the *format-spec* (28.5.2) of the replacement field being formatted in the format string. If *format-spec* is not present or empty then either `pc.begin() == pc.end()` or `*pc.begin() == '}'`.

28.5.6.2 Formatter locking [format.formatter.locking]

```
template<class T>
  constexpr bool enable_nonlocking_formatter_optimization = false;
```

1 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `enable_nonlocking_formatter_optimization` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7.4) and have type `const bool`.

28.5.6.3 Concept `formattable` [format.formattable]

1 Let *`fmt-iter-for`*`<charT>` be an unspecified type that models `output_iterator<const charT&>` (24.3.4.10).

```
template<class T, class Context,
         class Formatter = typename Context::template formatter_type<remove_const_t<T>>>
  concept formattable-with =                    // exposition only
    semiregular<Formatter> &&
    requires(Formatter& f, const Formatter& cf, T&& t, Context fc,
```

Table 112 — *BasicFormatter* requirements [tab:formatter.basic]

Expression	Return type	Requirement
`g.parse(pc)`	`PC::iterator`	Parses *format-spec* (28.5.2) for type `T` in the range [`pc.begin()`, `pc.end()`) until the first unmatched character. Throws `format_error` unless the whole range is parsed or the unmatched character is `}`. [*Note 1*: This allows formatters to emit meaningful error messages. — *end note*] Stores the parsed format specifiers in `*this` and returns an iterator past the end of the parsed range.
`f.format(u, fc)`	`FC::iterator`	Formats `u` according to the specifiers stored in `*this`, writes the output to `fc.out()`, and returns an iterator past the end of the output range. The output shall only depend on `u`, `fc.locale()`, `fc.arg(n)` for any value `n` of type `size_t`, and the range [`pc.begin()`, `pc.end()`) from the last call to `f.parse(pc)`.

Table 113 — *Formatter* requirements [tab:formatter]

Expression	Return type	Requirement
`f.format(t, fc)`	`FC::iterator`	Formats `t` according to the specifiers stored in `*this`, writes the output to `fc.out()`, and returns an iterator past the end of the output range. The output shall only depend on `t`, `fc.locale()`, `fc.arg(n)` for any value `n` of type `size_t`, and the range [`pc.begin()`, `pc.end()`) from the last call to `f.parse(pc)`.
`f.format(u, fc)`	`FC::iterator`	As above, but does not modify `u`.

```
          basic_format_parse_context<typename Context::char_type> pc)
  {
    { f.parse(pc) } -> same_as<typename decltype(pc)::iterator>;
    { cf.format(t, fc) } -> same_as<typename Context::iterator>;
  };

template<class T, class charT>
  concept formattable =
    formattable-with<remove_reference_t<T>, basic_format_context<fmt-iter-for<charT>, charT>>;
```

2 A type `T` and a character type `charT` model `formattable` if `formatter<remove_cvref_t<T>, charT>` meets the *BasicFormatter* requirements (28.5.6.1) and, if `remove_reference_t<T>` is const-qualified, the *Formatter* requirements.

28.5.6.4 Formatter specializations [format.formatter.spec]

1 The functions defined in 28.5.5 use specializations of the class template `formatter` to format individual arguments.

2 Let `charT` be either `char` or `wchar_t`. Each specialization of `formatter` is either enabled or disabled, as described below. A *debug-enabled* specialization of `formatter` additionally provides a public, constexpr, non-static member function `set_debug_format()` which modifies the state of the `formatter` to be as if the type of the *std-format-spec* parsed by the last call to `parse` were `?`. A *constexpr-enabled* specialization of `formatter` has its `format` member function declared `constexpr`. Each header that declares the template `formatter` provides the following enabled specializations:

(2.1) — The debug-enabled and constexpr-enabled specializations

```
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```

(2.2) — For each `charT`, the debug-enabled and constexpr-enabled string type specializations

```
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<charT[N], charT>;
template<class traits, class Allocator>
  struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
  struct formatter<basic_string_view<charT, traits>, charT>;
```

(2.3) — For each `charT`, for each `IntegerT` that is either a signed or unsigned integer type or `bool`, a constexpr-enabled specialization

```
template<> struct formatter<IntegerT, charT>;
```

(2.4) — For each `charT`, for each `FloatingT` that is a cv-unqualified floating-point type, a specialization

```
template<> struct formatter<FloatingT, charT>;
```

(2.5) — For each `charT`, the constexpr-enabled pointer type specialization

```
template<> struct formatter<nullptr_t, charT>;
```

(2.6) — For each `charT`, the pointer type specializations

```
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The `parse` member functions of these formatters interpret the format specification as a *std-format-spec* as described in 28.5.2.2.

3 Unless specified otherwise, for each type `T` for which a `formatter` specialization is provided by the library, each of the headers provides the following specialization:

```
template<> inline constexpr bool enable_nonlocking_formatter_optimization<T> = true;
```

[*Note 1*: Specializations such as `formatter<wchar_t, char>` that would require implicit multibyte / wide string or character conversion are disabled. — *end note*]

4 The header `<format>` provides the following disabled specializations:

(4.1) — The string type specializations

```
template<> struct formatter<char*, wchar_t>;
template<> struct formatter<const char*, wchar_t>;
template<size_t N> struct formatter<char[N], wchar_t>;
template<class traits, class Allocator>
  struct formatter<basic_string<char, traits, Allocator>, wchar_t>;
template<class traits>
  struct formatter<basic_string_view<char, traits>, wchar_t>;
```

5 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.

6 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled and meets the *Formatter* requirements except as noted otherwise.

7 If `F` is a disabled specialization of `formatter`, these values are `false`:

(7.1) — `is_default_constructible_v<F>`,

(7.2) — `is_copy_constructible_v<F>`,

(7.3) — `is_move_constructible_v<F>`,

(7.4) — `is_copy_assignable_v<F>`, and

(7.5) — `is_move_assignable_v<F>`.

8 An enabled specialization `formatter<T, charT>` meets the *BasicFormatter* requirements (28.5.6.1).

[*Example 1*:

```
#include <format>
#include <string>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };

template<> struct std::formatter<color> : std::formatter<const char*> {
  auto format(color c, format_context& ctx) const {
    return formatter<const char*>::format(color_names[c], ctx);
  }
};

struct err {};

std::string s0 = std::format("{}", 42);          // OK, library-provided formatter
std::string s1 = std::format("{}", L"foo");      // error: disabled formatter
std::string s2 = std::format("{}", red);         // OK, user-provided formatter
std::string s3 = std::format("{}", err{});       // error: disabled formatter
```

— *end example*]

28.5.6.5 Formatting escaped characters and strings [format.string.escaped]

1 A character or string can be formatted as *escaped* to make it more suitable for debugging or for logging.

2 The escaped string E representation of a string S is constructed by encoding a sequence of characters as follows. The associated character encoding CE for `charT` (Table 12) is used to both interpret S and construct E.

(2.1) — U+0022 QUOTATION MARK (") is appended to E.

(2.2) — For each code unit sequence X in S that either encodes a single character, is a shift sequence, or is a sequence of ill-formed code units, processing is in order as follows:

(2.2.1) — If X encodes a single character C, then:

(2.2.1.1) — If C is one of the characters in Table 114, then the two characters shown as the corresponding escape sequence are appended to E.

(2.2.1.2) — Otherwise, if C is not U+0020 SPACE and

(2.2.1.2) — CE is UTF-8, UTF-16, or UTF-32 and C corresponds to a Unicode scalar value whose Unicode property `General_Category` has a value in the groups `Separator` (`Z`) or `Other` (`C`), as described by UAX #44 of the Unicode Standard, or

(2.2.1.2) — CE is UTF-8, UTF-16, or UTF-32 and C corresponds to a Unicode scalar value with the Unicode property `Grapheme_Extend=Yes` as described by UAX #44 of the Unicode Standard and C is not immediately preceded in S by a character P appended to E without translation to an escape sequence, or

(2.2.1.2) — CE is neither UTF-8, UTF-16, nor UTF-32 and C is one of an implementation-defined set of separator or non-printable characters

then the sequence `\u{`*`hex-digit-sequence`*`}` is appended to E, where *`hex-digit-sequence`* is the shortest hexadecimal representation of C using lower-case hexadecimal digits.

(2.2.1.3) — Otherwise, C is appended to E.

(2.2.2) — Otherwise, if X is a shift sequence, the effect on E and further decoding of S is unspecified.

Recommended practice: A shift sequence should be represented in E such that the original code unit sequence of S can be reconstructed.

(2.2.3) — Otherwise (X is a sequence of ill-formed code units), each code unit U is appended to E in order as the sequence `\x{`*`hex-digit-sequence`*`}`, where *`hex-digit-sequence`* is the shortest hexadecimal representation of U using lower-case hexadecimal digits.

(2.3) — Finally, U+0022 QUOTATION MARK (") is appended to E.

3 The escaped string representation of a character C is equivalent to the escaped string representation of a string of C, except that:

(3.1) — the result starts and ends with U+0027 APOSTROPHE (') instead of U+0022 QUOTATION MARK ("), and

Table 114 — Mapping of characters to escape sequences [tab:format.escape.sequences]

Character	Escape sequence
U+0009 CHARACTER TABULATION	\t
U+000A LINE FEED	\n
U+000D CARRIAGE RETURN	\r
U+0022 QUOTATION MARK	\"
U+005C REVERSE SOLIDUS	\\

(3.2) — if C is U+0027 APOSTROPHE, the two characters \' are appended to E, and

(3.3) — if C is U+0022 QUOTATION MARK, then C is appended unchanged.

[*Example 1*:

```
string s0 = format("[{}]", "h\tllo");                  // s0 has value: [h    llo]
string s1 = format("[{:?}]", "h\tllo");                // s1 has value: ["h\tllo"]
string s2 = format("[{:?}]", "Спасибо, Виктор ❤️!");   // s2 has value: ["Спасибо, Виктор ❤️!"]
string s3 = format("[{:?}, {:?}]", '\'', '"');         // s3 has value: ['\'', '"']

// The following examples assume use of the UTF-8 encoding
string s4 = format("[{:?}]", string("\0 \n \t \x02 \x1b", 9));
                                                       // s4 has value: ["\u{0} \n \t \u{2} \u{1b}"]
string s5 = format("[{:?}]", "\xc3\x28");              // invalid UTF-8, s5 has value: ["\x{c3}("]
string s6 = format("[{:?}]", "👨‍♂️");                  // s6 has value: ["👨\u{200d}♂️"]
string s7 = format("[{:?}]", "\u0301");                // s7 has value: ["\u{301}"]
string s8 = format("[{:?}]", "\\\u0301");              // s8 has value: ["\\\u{301}"]
string s9 = format("[{:?}]", "e\u0301\u0323");         // s9 has value: ["ẹ́"]
```

— *end example*]

28.5.6.6 Class template basic_format_parse_context [format.parse.ctx]

```
namespace std {
  template<class charT>
  class basic_format_parse_context {
  public:
    using char_type = charT;
    using const_iterator = basic_string_view<charT>::const_iterator;
    using iterator = const_iterator;

  private:
    iterator begin_;                                   // exposition only
    iterator end_;                                     // exposition only
    enum indexing { unknown, manual, automatic };      // exposition only
    indexing indexing_;                                // exposition only
    size_t next_arg_id_;                               // exposition only
    size_t num_args_;                                  // exposition only

  public:
    constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt) noexcept;
    basic_format_parse_context(const basic_format_parse_context&) = delete;
    basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;

    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr void advance_to(const_iterator it);

    constexpr size_t next_arg_id();
    constexpr void check_arg_id(size_t id);

    template<class... Ts>
      constexpr void check_dynamic_spec(size_t id) noexcept;
    constexpr void check_dynamic_spec_integral(size_t id) noexcept;
```

```
    constexpr void check_dynamic_spec_string(size_t id) noexcept;
  };
}
```

1 An instance of `basic_format_parse_context` holds the format string parsing state, consisting of the format string range being parsed and the argument counter for automatic indexing.

2 If a program declares an explicit or partial specialization of `basic_format_parse_context`, the program is ill-formed, no diagnostic required.

```
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt) noexcept;
```

3 *Effects*: Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with `0`, and `num_args_` with `0`.

[*Note 1*: Any call to `next_arg_id`, `check_arg_id`, or `check_dynamic_spec` on an instance of `basic_format_parse_context` initialized using this constructor is not a core constant expression. — *end note*]

```
constexpr const_iterator begin() const noexcept;
```

4 *Returns*: `begin_`.

```
constexpr const_iterator end() const noexcept;
```

5 *Returns*: `end_`.

```
constexpr void advance_to(const_iterator it);
```

6 *Preconditions*: `end()` is reachable from `it`.

7 *Effects*: Equivalent to: `begin_ = it;`

```
constexpr size_t next_arg_id();
```

8 *Effects*: If `indexing_ != manual` is `true`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = automatic;
return next_arg_id_++;
```

9 *Throws*: `format_error` if `indexing_ == manual` is `true`.

[*Note 2*: This indicates mixing of automatic and manual argument indexing. — *end note*]

10 *Remarks*: Let *`cur-arg-id`* be the value of `next_arg_id_` prior to this call. Call expressions where *`cur-arg-id`* `>= num_args_` is `true` are not core constant expressions (7.7.2).

```
constexpr void check_arg_id(size_t id);
```

11 *Effects*: If `indexing_ != automatic` is `true`, equivalent to:

```
if (indexing_ == unknown)
  indexing_ = manual;
```

12 *Throws*: `format_error` if `indexing_ == automatic` is `true`.

[*Note 3*: This indicates mixing of automatic and manual argument indexing. — *end note*]

13 *Remarks*: A call to this function is a core constant expression (7.7.2) only if `id < num_args_` is `true`.

```
template<class... Ts>
  constexpr void check_dynamic_spec(size_t id) noexcept;
```

14 *Mandates*: `sizeof...(Ts)` ≥ 1. The types in `Ts...` are unique. Each type in `Ts...` is one of `bool`, `char_type`, `int`, `unsigned int`, `long long int`, `unsigned long long int`, `float`, `double`, `long double`, `const char_type*`, `basic_string_view<char_type>`, or `const void*`.

15 *Remarks*: A call to this function is a core constant expression only if

(15.1) — `id < num_args_` is `true` and

(15.2) — the type of the corresponding format argument (after conversion to `basic_format_arg<Context>`) is one of the types in `Ts...`.

```
constexpr void check_dynamic_spec_integral(size_t id) noexcept;
```

16 *Effects*: Equivalent to:

```
      check_dynamic_spec<int, unsigned int, long long int, unsigned long long int>(id);
```

```
constexpr void check_dynamic_spec_string(size_t id) noexcept;
```

17 *Effects*: Equivalent to:

```
      check_dynamic_spec<const char_type*, basic_string_view<char_type>>(id);
```

28.5.6.7 Class template `basic_format_context` [format.context]

```
namespace std {
  template<class Out, class charT>
  class basic_format_context {
    basic_format_args<basic_format_context> args_;       // exposition only
    Out out_;                                            // exposition only

    basic_format_context(const basic_format_context&) = delete;
    basic_format_context& operator=(const basic_format_context&) = delete;

  public:
    using iterator = Out;
    using char_type = charT;
    template<class T> using formatter_type = formatter<T, charT>;

    constexpr basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
    std::locale locale();

    constexpr iterator out();
    constexpr void advance_to(iterator it);
  };
}
```

1 An instance of `basic_format_context` holds formatting state consisting of the formatting arguments and the output iterator.

2 If a program declares an explicit or partial specialization of `basic_format_context`, the program is ill-formed, no diagnostic required.

3 `Out` shall model `output_iterator<const charT&>`.

4 `format_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `string`, such as `back_insert_iterator<string>`. Similarly, `wformat_context` is an alias for a specialization of `basic_format_context` with an output iterator that appends to `wstring`.

5 *Recommended practice*: For a given type `charT`, implementations should provide a single specialization of `basic_format_context` for appending to `basic_string<charT>`, `vector<charT>`, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a `span<charT>`) and polymorphic reallocation.

```
constexpr basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
```

6 *Returns*: `args_.get(id)`.

```
std::locale locale();
```

7 *Returns*: The locale passed to the formatting function if the latter takes one, and `std::locale()` otherwise.

```
constexpr iterator out();
```

8 *Effects*: Equivalent to: `return std::move(out_);`

```
constexpr void advance_to(iterator it);
```

9 *Effects*: Equivalent to: `out_ = std::move(it);`

[*Example 1*:

```
struct S { int value; };

template<> struct std::formatter<S> {
  size_t width_arg_id = 0;
```

```
    // Parses a width argument id in the format { digit }.
    constexpr auto parse(format_parse_context& ctx) {
      auto iter = ctx.begin();
      auto is_digit = [](auto c) { return c >= '0' && c <= '9'; };
      auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; };
      if (get_char() != '{')
        return iter;
      ++iter;
      char c = get_char();
      if (!is_digit(c) || (++iter, get_char()) != '}')
        throw format_error("invalid format");
      width_arg_id = c - '0';
      ctx.check_arg_id(width_arg_id);
      return ++iter;
    }

    // Formats an S with width given by the argument width_arg_id.
    auto format(S s, format_context& ctx) const {
      int width = ctx.arg(width_arg_id).visit([](auto value) -> int {
        if constexpr (!is_integral_v<decltype(value)>)
          throw format_error("width is not integral");
        else if (value < 0 || value > numeric_limits<int>::max())
          throw format_error("invalid width");
        else
          return value;
        });
      return format_to(ctx.out(), "{0:x>{1}}", s.value, width);
    }
  };

  std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"
```

— *end example*]

28.5.7 Formatting of ranges [format.range]

28.5.7.1 Variable template format_kind [format.range.fmtkind]

```
template<ranges::input_range R>
  requires same_as<R, remove_cvref_t<R>>
  constexpr range_format format_kind<R> = see below;
```

1 A program that instantiates the primary template of `format_kind` is ill-formed.

2 For a type `R`, `format_kind<R>` is defined as follows:

(2.1) — If `same_as<remove_cvref_t<ranges::range_reference_t<R>>, R>` is `true`, `format_kind<R>` is `range_format::disabled`.

[*Note 1*: This prevents constraint recursion for ranges whose reference type is the same range type. For example, `std::filesystem::path` is a range of `std::filesystem::path`. — *end note*]

(2.2) — Otherwise, if the *qualified-id* `R::key_type` is valid and denotes a type:

(2.2.1) — If the *qualified-id* `R::mapped_type` is valid and denotes a type, let `U` be `remove_cvref_t<ranges::range_reference_t<R>>`. If either `U` is a specialization of `pair` or `U` is a specialization of `tuple` and `tuple_size_v<U> == 2`, `format_kind<R>` is `range_format::map`.

(2.2.2) — Otherwise, `format_kind<R>` is `range_format::set`.

(2.3) — Otherwise, `format_kind<R>` is `range_format::sequence`.

3 *Remarks*: Pursuant to 16.4.5.2.1, users may specialize `format_kind` for cv-unqualified program-defined types that model `ranges::input_range`. Such specializations shall be usable in constant expressions (7.7.4) and have type `const range_format`.

28.5.7.2 Class template range_formatter [format.range.formatter]

```
namespace std {
  template<class T, class charT = char>
```

```
    requires same_as<remove_cvref_t<T>, T> && formattable<T, charT>
  class range_formatter {
    formatter<T, charT> underlying_;                                    // exposition only
    basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", "); // exposition only
    basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("["); // exposition only
    basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>("]"); // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;
    constexpr formatter<T, charT>& underlying() noexcept { return underlying_; }
    constexpr const formatter<T, charT>& underlying() const noexcept { return underlying_; }

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<ranges::input_range R, class FormatContext>
        requires formattable<ranges::range_reference_t<R>, charT> &&
                 same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
      constexpr typename FormatContext::iterator
        format(R&& r, FormatContext& ctx) const;
  };
}
```

1 The class template `range_formatter` is a utility for implementing `formatter` specializations for range types.

2 `range_formatter` interprets *format-spec* as a *range-format-spec*. The syntax of format specifications is as follows:

range-format-spec:
    range-fill-and-align$_{opt}$ *width*$_{opt}$ `n`$_{opt}$ *range-type*$_{opt}$ *range-underlying-spec*$_{opt}$

range-fill-and-align:
    range-fill$_{opt}$ *align*

range-fill:
    any character other than `{` or `}` or `:`

range-type:
    `m`
    `s`
    `?s`

range-underlying-spec:
    `:` *format-spec*

3 For `range_formatter<T, charT>`, the *format-spec* in a *range-underlying-spec*, if any, is interpreted by `formatter<T, charT>`.

4 The *range-fill-and-align* is interpreted the same way as a *fill-and-align* (28.5.2.2). The productions *align* and *width* are described in 28.5.2.

5 The `n` option causes the range to be formatted without the opening and closing brackets.

[*Note 1*: This is equivalent to invoking `set_brackets({}, {})`. — *end note*]

6 The *range-type* specifier changes the way a range is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 115.

If the *range-type* is `s` or `?s`, then there shall be no `n` option and no *range-underlying-spec*.

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

7 *Effects*: Equivalent to: `separator_ = sep;`

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

8 *Effects*: Equivalent to:

```
opening-bracket_ = opening;
```

Table 115 — Meaning of *range-type* options [tab:formatter.range.type]

Option	Requirements	Meaning
`m`	`T` shall be either a specialization of `pair` or a specialization of `tuple` such that `tuple_size_v<T>` is 2.	Indicates that the opening bracket should be `"{"`, the closing bracket should be `"}"`, the separator should be `", "`, and each range element should be formatted as if `m` were specified for its *tuple-type*. [*Note 2*: If the `n` option is provided in addition to the `m` option, both the opening and closing brackets are still empty. — *end note*]
`s`	`T` shall be `charT`.	Indicates that the range should be formatted as a `string`.
`?s`	`T` shall be `charT`.	Indicates that the range should be formatted as an escaped string (28.5.6.5).

```
    closing-bracket_ = closing;

template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

9 *Effects*: Parses the format specifiers as a *range-format-spec* and stores the parsed specifiers in `*this`. Calls *`underlying_`*`.parse(ctx)` to parse *format-spec* in *range-format-spec* or, if the latter is not present, an empty *format-spec*. The values of *`opening-bracket_`*, *`closing-bracket_`*, and *`separator_`* are modified if and only if required by the *range-type* or the `n` option, if present. If:

(9.1) — the *range-type* is neither `s` nor `?s`,

(9.2) — *`underlying_`*`.set_debug_format()` is a valid expression, and

(9.3) — there is no *range-underlying-spec*,

then calls *`underlying_`*`.set_debug_format()`.

10 *Returns*: An iterator past the end of the *range-format-spec*.

```
template<ranges::input_range R, class FormatContext>
    requires formattable<ranges::range_reference_t<R>, charT> &&
             same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
  constexpr typename FormatContext::iterator
    format(R&& r, FormatContext& ctx) const;
```

11 *Effects*: Writes the following into `ctx.out()`, adjusted according to the *range-format-spec*:

(11.1) — If the *range-type* was `s`, then as if by formatting `basic_string<charT>(from_range, r)`.

(11.2) — Otherwise, if the *range-type* was `?s`, then as if by formatting `basic_string<charT>(from_range, r)` as an escaped string (28.5.6.5).

(11.3) — Otherwise,

(11.3.1) — *`opening-bracket_`*,

(11.3.2) — for each element `e` of the range `r`:

(11.3.2.1) — the result of writing `e` via *`underlying_`* and

(11.3.2.2) — *`separator_`*, unless `e` is the last element of `r`, and

(11.3.3) — *`closing-bracket_`*.

12 *Returns*: An iterator past the end of the output range.

28.5.7.3 Class template *range-default-formatter* [format.range.fmtdef]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::sequence, R, charT> {    // exposition only
```

```
  private:
    using maybe-const-r = fmt-maybe-const<R, charT>;                    // exposition only
    range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-r>>,
                    charT> underlying_;                                 // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      constexpr typename FormatContext::iterator
        format(maybe-const-r& elems, FormatContext& ctx) const;
  };
}
```

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

1 *Effects*: Equivalent to: `underlying_.set_separator(sep);`

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

2 *Effects*: Equivalent to: `underlying_.set_brackets(opening, closing);`

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

3 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  constexpr typename FormatContext::iterator
    format(maybe-const-r& elems, FormatContext& ctx) const;
```

4 *Effects*: Equivalent to: `return underlying_.format(elems, ctx);`

28.5.7.4 Specialization of *range-default-formatter* for maps [format.range.fmtmap]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::map, R, charT> {
  private:
    using maybe-const-map = fmt-maybe-const<R, charT>;                  // exposition only
    using element-type =                                                // exposition only
      remove_cvref_t<ranges::range_reference_t<maybe-const-map>>;
    range_formatter<element-type, charT> underlying_;                   // exposition only

  public:
    constexpr range-default-formatter();

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      constexpr typename FormatContext::iterator
        format(maybe-const-map& r, FormatContext& ctx) const;
  };
}
```

```
constexpr range-default-formatter();
```

1 *Mandates*: Either:

(1.1) — *element-type* is a specialization of `pair`, or

(1.2) — *element-type* is a specialization of `tuple` and `tuple_size_v<`*element-type*`> == 2`.

2 *Effects*: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
underlying_.underlying().set_brackets({}, {});
underlying_.underlying().set_separator(STATICALLY-WIDEN<charT>(": "));
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

3 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  constexpr typename FormatContext::iterator
    format(maybe-const-map& r, FormatContext& ctx) const;
```

4 *Effects*: Equivalent to: `return underlying_.format(r, ctx);`

28.5.7.5 Specialization of *range-default-formatter* for sets [format.range.fmtset]

```
namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::set, R, charT> {
  private:
    using maybe-const-set = fmt-maybe-const<R, charT>;                  // exposition only
    range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-set>>,
                    charT> underlying_;                                 // exposition only

  public:
    constexpr range-default-formatter();

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      constexpr typename FormatContext::iterator
        format(maybe-const-set& r, FormatContext& ctx) const;
  };
}
```

```
constexpr range-default-formatter();
```

1 *Effects*: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

2 *Effects*: Equivalent to: `return underlying_.parse(ctx);`

```
template<class FormatContext>
  constexpr typename FormatContext::iterator
    format(maybe-const-set& r, FormatContext& ctx) const;
```

3 *Effects*: Equivalent to: `return underlying_.format(r, ctx);`

28.5.7.6 Specialization of *range-default-formatter* for strings [format.range.fmtstr]

```
namespace std {
  template<range_format K, ranges::input_range R, class charT>
    requires (K == range_format::string || K == range_format::debug_string)
  struct range-default-formatter<K, R, charT> {
  private:
    formatter<basic_string<charT>, charT> underlying_;                  // exposition only
```

```
  public:
    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      constexpr typename FormatContext::iterator
        format(see below& str, FormatContext& ctx) const;
  };
}
```

1 *Mandates*: `same_as<remove_cvref_t<range_reference_t<R>>, charT>` is `true`.

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

2 *Effects*: Equivalent to:

```
auto i = underlying_.parse(ctx);
if constexpr (K == range_format::debug_string) {
  underlying_.set_debug_format();
}
return i;
```

```
template<class FormatContext>
  typename FormatContext::iterator
    format(see below& r, FormatContext& ctx) const;
```

3 The type of `r` is `const R&` if `ranges::input_range<const R>` is `true` and `R&` otherwise.

4 *Effects*: Let *s* be a `basic_string<charT>` such that `ranges::equal(s, r)` is `true`. Equivalent to: `return underlying_.format(s, ctx);`

28.5.8 Arguments [format.arguments]

28.5.8.1 Class template `basic_format_arg` [format.arg]

```
namespace std {
  template<class Context>
  class basic_format_arg {
  public:
    class handle;

  private:
    using char-type = Context::char_type;                                   // exposition only

    variant<monostate, bool, char-type,
            int, unsigned int, long long int, unsigned long long int,
            float, double, long double,
            const char-type*, basic_string_view<char-type>,
            const void*, handle> value_;                                    // exposition only

    template<class T> constexpr explicit basic_format_arg(T& v) noexcept;   // exposition only

  public:
    constexpr basic_format_arg() noexcept;

    constexpr explicit operator bool() const noexcept;

    template<class Visitor>
      constexpr decltype(auto) visit(this basic_format_arg arg, Visitor&& vis);
    template<class R, class Visitor>
      constexpr R visit(this basic_format_arg arg, Visitor&& vis);
  };
}
```

1 An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.

2 The behavior of a program that adds specializations of `basic_format_arg` is undefined.

```
constexpr basic_format_arg() noexcept;
```

3 *Postconditions*: `!(*this)`.

```
template<class T> constexpr explicit basic_format_arg(T& v) noexcept;
```

4 *Constraints*: `T` satisfies *`formattable-with`*`<Context>`.

5 *Preconditions*: If `decay_t<T>` is *`char-type`*`*` or `const` *`char-type`*`*`, `static_cast<const` *`char-type`*`*>(v)` points to an NTCTS (3.36).

6 *Effects*: Let `TD` be `remove_const_t<T>`.

(6.1) — If `TD` is `bool` or *`char-type`*, initializes *`value_`* with `v`;

(6.2) — otherwise, if `TD` is `char` and *`char-type`* is `wchar_t`, initializes *`value_`* with `static_cast<wchar_t>(static_cast<unsigned char>(v))`;

(6.3) — otherwise, if `TD` is a signed integer type (6.9.2) and `sizeof(TD) <= sizeof(int)`, initializes *`value_`* with `static_cast<int>(v)`;

(6.4) — otherwise, if `TD` is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned int)`, initializes *`value_`* with `static_cast<unsigned int>(v)`;

(6.5) — otherwise, if `TD` is a signed integer type and `sizeof(TD) <= sizeof(long long int)`, initializes *`value_`* with `static_cast<long long int>(v)`;

(6.6) — otherwise, if `TD` is an unsigned integer type and `sizeof(TD) <= sizeof(unsigned long long int)`, initializes *`value_`* with `static_cast<unsigned long long int>(v)`;

(6.7) — otherwise, if `TD` is a standard floating-point type, initializes *`value_`* with `v`;

(6.8) — otherwise, if `TD` is a specialization of `basic_string_view` or `basic_string` and `TD::value_type` is *`char-type`*, initializes *`value_`* with `basic_string_view<`*`char-type`*`>(v.data(), v.size())`;

(6.9) — otherwise, if `decay_t<TD>` is *`char-type`*`*` or `const` *`char-type`*`*`, initializes *`value_`* with `static_cast<const` *`char-type`*`*>(v)`;

(6.10) — otherwise, if `is_void_v<remove_pointer_t<TD>>` is `true` or `is_null_pointer_v<TD>` is `true`, initializes *`value_`* with `static_cast<const void*>(v)`;

(6.11) — otherwise, initializes *`value_`* with `handle(v)`.

[*Note 1*: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type. — *end note*]

```
constexpr explicit operator bool() const noexcept;
```

7 *Returns*: `!holds_alternative<monostate>(`*`value_`*`)`.

```
template<class Visitor>
  constexpr decltype(auto) visit(this basic_format_arg arg, Visitor&& vis);
```

8 *Effects*: Equivalent to: `return arg.`*`value_`*`.visit(std::forward<Visitor>(vis));`

```
template<class R, class Visitor>
  constexpr R visit(this basic_format_arg arg, Visitor&& vis);
```

9 *Effects*: Equivalent to: `return arg.`*`value_`*`.visit<R>(std::forward<Visitor>(vis));`

10 The class `handle` allows formatting an object of a user-defined type.

```
namespace std {
  template<class Context>
  class basic_format_arg<Context>::handle {
    const void* ptr_;                                          // exposition only
    void (*format_)(basic_format_parse_context<char-type>&,
                    Context&, const void*);                    // exposition only

    template<class T> constexpr explicit handle(T& val) noexcept;   // exposition only

  public:
    constexpr void format(basic_format_parse_context<char-type>&, Context& ctx) const;
```

```
  };
}
```

```
template<class T> constexpr explicit handle(T& val) noexcept;
```

11 Let

(11.1) — `TD` be `remove_const_t<T>`,

(11.2) — `TQ` be `const TD` if `const TD` satisfies *`formattable-with`*`<Context>` and `TD` otherwise.

12 *Mandates*: `TQ` satisfies *`formattable-with`*`<Context>`.

13 *Effects*: Initializes *`ptr_`* with `addressof(val)` and *`format_`* with

```
[](basic_format_parse_context<char-type>& parse_ctx,
   Context& format_ctx, const void* ptr) {
  typename Context::template formatter_type<TD> f;
  parse_ctx.advance_to(f.parse(parse_ctx));
  format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
                                 format_ctx));
}
```

```
constexpr void format(basic_format_parse_context<char-type>& parse_ctx, Context& format_ctx) const;
```

14 *Effects*: Equivalent to: *`format_`*`(parse_ctx, format_ctx, ptr_);`

28.5.8.2 Class template *format-arg-store* [format.arg.store]

```
namespace std {
  template<class Context, class... Args>
  class format-arg-store {                                  // exposition only
    array<basic_format_arg<Context>, sizeof...(Args)> args;  // exposition only
  };
}
```

1 An instance of *`format-arg-store`* stores formatting arguments.

```
template<class Context = format_context, class... Args>
  constexpr format-arg-store<Context, Args...>
    make_format_args(Args&... fmt_args);
```

2 *Preconditions*: The type `typename Context::template formatter_type<remove_const_t<`$\mathtt{T}_i$`>>` meets the *BasicFormatter* requirements (28.5.6.1) for each $\mathtt{T}_i$ in `Args`.

3 *Returns*: An object of type *`format-arg-store`*`<Context, Args...>` whose *`args`* data member is initialized with `{basic_format_arg<Context>(fmt_args)...}`.

```
template<class... Args>
  constexpr format-arg-store<wformat_context, Args...>
    make_wformat_args(Args&... args);
```

4 *Effects*: Equivalent to: `return make_format_args<wformat_context>(args...);`

28.5.8.3 Class template basic_format_args [format.args]

```
namespace std {
  template<class Context>
  class basic_format_args {
    size_t size_;                              // exposition only
    const basic_format_arg<Context>* data_;    // exposition only

  public:
    template<class... Args>
      constexpr basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

    constexpr basic_format_arg<Context> get(size_t i) const noexcept;
  };

  template<class Context, class... Args>
    basic_format_args(format-arg-store<Context, Args...>) -> basic_format_args<Context>;
}
```

1 An instance of `basic_format_args` provides access to formatting arguments.

2 *Recommended practice*: Implementations should optimize the representation of `basic_format_args` for a small number of formatting arguments.

[*Note 1*: For example, by storing indices of type alternatives separately from values and packing the former. — *end note*]

```
template<class... Args>
  constexpr basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

3 *Effects*: Initializes *size_* with `sizeof...(Args)` and *data_* with `store.`*args*`.data()`.

```
constexpr basic_format_arg<Context> get(size_t i) const noexcept;
```

4 *Returns*: `i < `*size_*` ? `*data_*`[i] : basic_format_arg<Context>()`.

28.5.9 Tuple formatter [format.tuple]

1 For each of `pair` and `tuple`, the library provides the following formatter specialization where *pair-or-tuple* is the name of the template:

```
namespace std {
  template<class charT, formattable<charT>... Ts>
  struct formatter<pair-or-tuple<Ts...>, charT> {
  private:
    tuple<formatter<remove_cvref_t<Ts>, charT>...> underlying_;                // exposition only
    basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(", ");       // exposition only
    basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("("); // exposition only
    basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>(")"); // exposition only

  public:
    constexpr void set_separator(basic_string_view<charT> sep) noexcept;
    constexpr void set_brackets(basic_string_view<charT> opening,
                                basic_string_view<charT> closing) noexcept;

    template<class ParseContext>
      constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);

    template<class FormatContext>
      constexpr typename FormatContext::iterator
        format(see below& elems, FormatContext& ctx) const;
  };

  template<class... Ts>
    constexpr bool enable_nonlocking_formatter_optimization<pair-or-tuple<Ts...>> =
      (enable_nonlocking_formatter_optimization<remove_cvref_t<Ts>> && ...);
}
```

2 The `parse` member functions of these formatters interpret the format specification as a *tuple-format-spec* according to the following syntax:

tuple-format-spec:
    tuple-fill-and-align$_{opt}$ *width*$_{opt}$ *tuple-type*$_{opt}$

tuple-fill-and-align:
    tuple-fill$_{opt}$ *align*

tuple-fill:
    any character other than `{` or `}` or `:`

tuple-type:
    `m`
    `n`

3 The *tuple-fill-and-align* is interpreted the same way as a *fill-and-align* (28.5.2.2). The productions *align* and *width* are described in 28.5.2.

4 The *tuple-type* specifier changes the way a `pair` or `tuple` is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 116.

Table 116 — Meaning of *tuple-type* options [tab:formatter.tuple.type]

Option	Requirements	Meaning
`m`	`sizeof...(Ts) == 2`	Equivalent to: `set_separator(`*`STATICALLY-WIDEN`*`<charT>(": "));` `set_brackets({}, {});`
`n`	none	Equivalent to: `set_brackets({}, {});`
none	none	No effects

```
constexpr void set_separator(basic_string_view<charT> sep) noexcept;
```

5 *Effects*: Equivalent to: *`separator_`* `= sep;`

```
constexpr void set_brackets(basic_string_view<charT> opening,
                            basic_string_view<charT> closing) noexcept;
```

6 *Effects*: Equivalent to:

```
opening-bracket_ = opening;
closing-bracket_ = closing;
```

```
template<class ParseContext>
  constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);
```

7 *Effects*: Parses the format specifiers as a *tuple-format-spec* and stores the parsed specifiers in `*this`. The values of *`opening-bracket_`*, *`closing-bracket_`*, and *`separator_`* are modified if and only if required by the *tuple-type*, if present. For each element *`e`* in *`underlying_`*, calls *`e`*`.parse(ctx)` to parse an empty *format-spec* and, if *`e`*`.set_debug_format()` is a valid expression, calls *`e`*`.set_debug_format()`.

8 *Returns*: An iterator past the end of the *tuple-format-spec*.

```
template<class FormatContext>
  constexpr typename FormatContext::iterator
    format(see below& elems, FormatContext& ctx) const;
```

9 The type of `elems` is:

(9.1) — If `(formattable<const Ts, charT> && ...)` is `true`, `const` *`pair-or-tuple`*`<Ts...>&`.

(9.2) — Otherwise *`pair-or-tuple`*`<Ts...>&`.

10 *Effects*: Writes the following into `ctx.out()`, adjusted according to the *tuple-format-spec*:

(10.1) — *`opening-bracket_`*,

(10.2) — for each index `I` in the $[0, \texttt{sizeof...(Ts)})$:

(10.2.1) — if `I != 0`, *`separator_`*,

(10.2.2) — the result of writing `get<I>(elems)` via `get<I>(`*`underlying_`*`)`, and

(10.3) — *`closing-bracket_`*.

11 *Returns*: An iterator past the end of the output range.

28.5.10 Class `format_error` [format.error]

```
namespace std {
  class format_error : public runtime_error {
  public:
    constexpr explicit format_error(const string& what_arg);
    constexpr explicit format_error(const char* what_arg);
  };
}
```

1 The class `format_error` defines the type of objects thrown as exceptions to report errors from the formatting library.

`constexpr format_error(const string& what_arg);`

2 *Postconditions*: `strcmp(what(), what_arg.c_str()) == 0`.

`constexpr format_error(const char* what_arg);`

3 *Postconditions*: `strcmp(what(), what_arg) == 0`.

28.6 Regular expressions library [re]

28.6.1 General [re.general]

1 Subclause 28.6 describes components that C++ programs may use to perform operations involving regular expression matching and searching.

2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (27.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 117.

Table 117 — Regular expressions library summary [tab:re.summary]

	Subclause	Header
28.6.2	Requirements	
28.6.4	Constants	`<regex>`
28.6.5	Exception type	
28.6.6	Traits	
28.6.7	Regular expression template	
28.6.8	Submatches	
28.6.9	Match results	
28.6.10	Algorithms	
28.6.11	Iterators	
28.6.12	Grammar	

3 The ECMAScript Language Specification described in Standard Ecma-262 is called *ECMA-262* in this Clause.

28.6.2 Requirements [re.req]

1 This subclause defines requirements on classes representing regular expression traits.

[*Note 1*: The class template `regex_traits`, defined in 28.6.6, meets these requirements. — *end note*]

2 The class template `basic_regex`, defined in 28.6.7, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member *typedef-name*s and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.

3 To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.

4 In the following requirements,

(4.1) — `X` denotes a traits class defining types and functions for the character container type `charT`;

(4.2) — `u` is an object of type `X`;

(4.3) — `v` is an object of type `const X`;

(4.4) — `p` is a value of type `const charT*`;

(4.5) — `I1` and `I2` are input iterators (24.3.5.3);

(4.6) — `F1` and `F2` are forward iterators (24.3.5.5);

(4.7) — `c` is a value of type `const charT`;

(4.8) — `s` is an object of type `X::string_type`;

(4.9) — `cs` is an object of type `const X::string_type`;

(4.10) — `b` is a value of type `bool`;

(4.11) — `I` is a value of type `int`;

(4.12) — `cl` is an object of type `X::char_class_type`; and

(4.13) — `loc` is an object of type `X::locale_type`.

5 A traits class `X` meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

`typename X::char_type`

6 *Result*: `charT`, the character container type used in the implementation of class template `basic_regex`.

`typename X::string_type`

7 *Result*: `basic_string<charT>`

`typename X::locale_type`

8 *Result*: A copy constructible type that represents the locale used by the traits class.

`typename X::char_class_type`

9 *Result*: A bitmask type (16.3.3.3.3) representing a particular character classification.

`X::length(p)`

10 *Result*: `size_t`

11 *Returns*: The smallest `i` such that `p[i] == 0`.

12 *Complexity*: Linear in `i`.

`v.translate(c)`

13 *Result*: `X::char_type`

14 *Returns*: A character such that for any character `d` that is to be considered equivalent to `c` then `v.translate(c) == v.translate(d)`.

`v.translate_nocase(c)`

15 *Result*: `X::char_type`

16 *Returns*: For all characters `C` that are to be considered equivalent to `c` when comparisons are to be performed without regard to case, then `v.translate_nocase(c) == v.translate_nocase(C)`.

`v.transform(F1, F2)`

17 *Result*: `X::string_type`

18 *Returns*: A sort key for the character sequence designated by the iterator range [`F1`, `F2`) such that if the character sequence [`G1`, `G2`) sorts before the character sequence [`H1`, `H2`) then `v.transform(G1, G2) < v.transform(H1, H2)`.

`v.transform_primary(F1, F2)`

19 *Result*: `X::string_type`

20 *Returns*: A sort key for the character sequence designated by the iterator range [`F1`, `F2`) such that if the character sequence [`G1`, `G2`) sorts before the character sequence [`H1`, `H2`) when character case is not considered then `v.transform_primary(G1, G2) < v.transform_primary(H1, H2)`.

`v.lookup_collatename(F1, F2)`

21 *Result*: `X::string_type`

22 *Returns*: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [`F1`, `F2`). Returns an empty string if the character sequence is not a valid collating element.

`v.lookup_classname(F1, F2, b)`

23 *Result*: `X::char_class_type`

24 *Returns*: Converts the character sequence designated by the iterator range [`F1`, `F2`) into a value of a bitmask type that can subsequently be passed to `isctype`. Values returned from `lookup_classname` can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If `b` is `true`, the returned bitmask is suitable for matching characters without regard to their case. Returns `0` if the character sequence is not the name of a character class recognized by `X`. The value returned shall be independent of the case of the characters in the sequence.

`v.isctype(c, cl)`

25 *Result*: `bool`

26 *Returns*: Returns `true` if character `c` is a member of one of the character classes designated by `cl`, `false` otherwise.

`v.value(c, I)`

27 *Result*: `int`

28 *Returns*: Returns the value represented by the digit c in base I if the character c is a valid digit in base I; otherwise returns `-1`.

[*Note 2*: The value of I will only be 8, 10, or 16. — *end note*]

`u.imbue(loc)`

29 *Result*: `X::locale_type`

30 *Effects*: Imbues `u` with the locale `loc` and returns the previous locale used by `u` if any.

`v.getloc()`

31 *Result*: `X::locale_type`

32 *Returns*: Returns the current locale used by `v`, if any.

33 [*Note 3*: Class template `regex_traits` meets the requirements for a regular expression traits class when it is specialized for `char` or `wchar_t`. This class template is described in the header `<regex>`, and is described in 28.6.6. — *end note*]

28.6.3 Header <regex> synopsis [re.syn]

```
#include <compare>              // see 17.12.1
#include <initializer_list>     // see 17.11.2

namespace std {
  // 28.6.4, regex constants
  namespace regex_constants {
    using syntax_option_type = T1;
    using match_flag_type = T2;
    using error_type = T3;
  }

  // 28.6.5, class regex_error
  class regex_error;

  // 28.6.6, class template regex_traits
  template<class charT> struct regex_traits;

  // 28.6.7, class template basic_regex
  template<class charT, class traits = regex_traits<charT>> class basic_regex;

  using regex  = basic_regex<char>;
  using wregex = basic_regex<wchar_t>;

  // 28.6.7.6, basic_regex swap
  template<class charT, class traits>
    void swap(basic_regex<charT, traits>& e1, basic_regex<charT, traits>& e2);

  // 28.6.8, class template sub_match
  template<class BidirectionalIterator>
    class sub_match;
```

```
using csub_match  = sub_match<const char*>;
using wcsub_match = sub_match<const wchar_t*>;
using ssub_match  = sub_match<string::const_iterator>;
using wssub_match = sub_match<wstring::const_iterator>;

// 28.6.8.3, sub_match non-member operators
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

  }
}
```

28.6.4 Namespace `std::regex_constants` [re.const]

28.6.4.1 General [re.const.general]

[1] The namespace `std::regex_constants` holds symbolic constants used by the regular expression library. This namespace provides three types, `syntax_option_type`, `match_flag_type`, and `error_type`, along with several constants of these types.

28.6.4.2 Bitmask type `syntax_option_type` [re.synopt]

```
namespace std::regex_constants {
  using syntax_option_type = T1;
  inline constexpr syntax_option_type icase = unspecified;
  inline constexpr syntax_option_type nosubs = unspecified;
  inline constexpr syntax_option_type optimize = unspecified;
  inline constexpr syntax_option_type collate = unspecified;
  inline constexpr syntax_option_type ECMAScript = unspecified;
  inline constexpr syntax_option_type basic = unspecified;
  inline constexpr syntax_option_type extended = unspecified;
  inline constexpr syntax_option_type awk = unspecified;
  inline constexpr syntax_option_type grep = unspecified;
  inline constexpr syntax_option_type egrep = unspecified;
  inline constexpr syntax_option_type multiline = unspecified;
}
```

[1] The type `syntax_option_type` is an implementation-defined bitmask type (16.3.3.3.3). Setting its elements has the effects listed in Table 118. A valid value of type `syntax_option_type` shall have at most one of the grammar elements `ECMAScript`, `basic`, `extended`, `awk`, `grep`, `egrep`, set. If no grammar element is set, the default grammar is `ECMAScript`.

28.6.4.3 Bitmask type `match_flag_type` [re.matchflag]

```
namespace std::regex_constants {
  using match_flag_type = T2;
  inline constexpr match_flag_type match_default = {};
  inline constexpr match_flag_type match_not_bol = unspecified;
  inline constexpr match_flag_type match_not_eol = unspecified;
  inline constexpr match_flag_type match_not_bow = unspecified;
  inline constexpr match_flag_type match_not_eow = unspecified;
  inline constexpr match_flag_type match_any = unspecified;
  inline constexpr match_flag_type match_not_null = unspecified;
  inline constexpr match_flag_type match_continuous = unspecified;
  inline constexpr match_flag_type match_prev_avail = unspecified;
  inline constexpr match_flag_type format_default = {};
  inline constexpr match_flag_type format_sed = unspecified;
  inline constexpr match_flag_type format_no_copy = unspecified;
  inline constexpr match_flag_type format_first_only = unspecified;
}
```

[1] The type `match_flag_type` is an implementation-defined bitmask type (16.3.3.3.3). The constants of that type, except for `match_default` and `format_default`, are bitmask elements. The `match_default` and `format_default` constants are empty bitmasks. Matching a regular expression against a sequence of characters [`first`, `last`) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 119 for any bitmask elements set.

Table 118 — `syntax_option_type` effects [tab:re.synopt]

Element	Effect(s) if set
`icase`	Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.
`nosubs`	Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied `match_results` object.
`optimize`	Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.
`collate`	Specifies that character ranges of the form `"[a-b]"` shall be locale sensitive.
`ECMAScript`	Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in 28.6.12. See also: ECMA-262 15.10
`basic`	Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX. See also: POSIX, Base Definitions and Headers, Section 9.3
`extended`	Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX. See also: POSIX, Base Definitions and Headers, Section 9.4
`awk`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility awk in POSIX.
`grep`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep in POSIX.
`egrep`	Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep when given the -E option in POSIX.
`multiline`	Specifies that `^` shall match the beginning of a line and `$` shall match the end of a line, if the `ECMAScript` engine is selected.

Table 119 — `regex_constants::match_flag_type` effects [tab:re.matchflag]

Element	Effect(s) if set
`match_not_bol`	The first character in the sequence [`first`, `last`) shall be treated as though it is not at the beginning of a line, so the character `^` in the regular expression shall not match [`first`, `first`).
`match_not_eol`	The last character in the sequence [`first`, `last`) shall be treated as though it is not at the end of a line, so the character `"$"` in the regular expression shall not match [`last`, `last`).
`match_not_bow`	The expression `"\\b"` shall not match the sub-sequence [`first`, `first`).
`match_not_eow`	The expression `"\\b"` shall not match the sub-sequence [`last`, `last`).
`match_any`	If more than one match is possible then any match is an acceptable result.
`match_not_null`	The expression shall not match an empty sequence.
`match_continuous`	The expression shall only match a sub-sequence that begins at `first`.
`match_prev_avail`	`--first` is a valid iterator position. When this flag is set the flags `match_not_bol` and `match_not_bow` shall be ignored by the regular expression algorithms (28.6.10) and iterators (28.6.11).
`format_default`	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string.

©ISO/IEC

Table 119 — `regex_constants::match_flag_type` effects (continued)

Element	Effect(s) if set
`format_sed`	When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.
`format_no_copy`	During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.
`format_first_only`	When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.

28.6.4.4 Implementation-defined `error_type` [re.err]

```
namespace std::regex_constants {
  using error_type = T3;
  inline constexpr error_type error_collate = unspecified;
  inline constexpr error_type error_ctype = unspecified;
  inline constexpr error_type error_escape = unspecified;
  inline constexpr error_type error_backref = unspecified;
  inline constexpr error_type error_brack = unspecified;
  inline constexpr error_type error_paren = unspecified;
  inline constexpr error_type error_brace = unspecified;
  inline constexpr error_type error_badbrace = unspecified;
  inline constexpr error_type error_range = unspecified;
  inline constexpr error_type error_space = unspecified;
  inline constexpr error_type error_badrepeat = unspecified;
  inline constexpr error_type error_complexity = unspecified;
  inline constexpr error_type error_stack = unspecified;
}
```

1 The type `error_type` is an implementation-defined enumerated type (16.3.3.3.2). Values of type `error_type` represent the error conditions described in Table 120:

Table 120 — `error_type` values in the C locale [tab:re.err]

Value	Error condition
`error_collate`	The expression contains an invalid collating element name.
`error_ctype`	The expression contains an invalid character class name.
`error_escape`	The expression contains an invalid escaped character, or a trailing escape.
`error_backref`	The expression contains an invalid back reference.
`error_brack`	The expression contains mismatched `[` and `]`.
`error_paren`	The expression contains mismatched `(` and `)`.
`error_brace`	The expression contains mismatched `{` and `}`.
`error_badbrace`	The expression contains an invalid range in a `{}` expression.
`error_range`	The expression contains an invalid character range, such as `[b-a]` in most encodings.
`error_space`	There is insufficient memory to convert the expression into a finite state machine.
`error_badrepeat`	One of `*?+{` is not preceded by a valid regular expression.
`error_complexity`	The complexity of an attempted match against a regular expression exceeds a pre-set level.
`error_stack`	There is insufficient memory to determine whether the regular expression matches the specified character sequence.

28.6.5 Class `regex_error` [re.badexp]

```
namespace std {
  class regex_error : public runtime_error {
  public:
    explicit regex_error(regex_constants::error_type ecode);
    regex_constants::error_type code() const;
```

```
  };
}
```

1 The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```
regex_error(regex_constants::error_type ecode);
```

2 *Postconditions*: `ecode == code()`.

```
regex_constants::error_type code() const;
```

3 *Returns*: The error code that was passed to the constructor.

28.6.6 Class template `regex_traits` [re.traits]

```
namespace std {
  template<class charT>
    struct regex_traits {
      using char_type       = charT;
      using string_type     = basic_string<char_type>;
      using locale_type     = locale;
      using char_class_type = bitmask_type;

      regex_traits();
      static size_t length(const char_type* p);
      charT translate(charT c) const;
      charT translate_nocase(charT c) const;
      template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        string_type transform_primary(
          ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        string_type lookup_collatename(
          ForwardIterator first, ForwardIterator last) const;
      template<class ForwardIterator>
        char_class_type lookup_classname(
          ForwardIterator first, ForwardIterator last, bool icase = false) const;
      bool isctype(charT c, char_class_type f) const;
      int value(charT ch, int radix) const;
      locale_type imbue(locale_type l);
      locale_type getloc() const;
    };
}
```

1 The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (28.6.2).

```
using char_class_type = bitmask_type;
```

2 The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```
static size_t length(const char_type* p);
```

3 *Returns*: `char_traits<charT>::length(p)`.

```
charT translate(charT c) const;
```

4 *Returns*: `c`.

```
charT translate_nocase(charT c) const;
```

5 *Returns*: `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```
template<class ForwardIterator>
  string_type transform(ForwardIterator first, ForwardIterator last) const;
```

6 *Effects*: As if by:

```
    string_type str(first, last);
    return use_facet<collate<charT>>(
      getloc()).transform(str.data(), str.data() + str.length());
```

```
template<class ForwardIterator>
  string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
```

7 *Effects*: If

```
typeid(use_facet<collate<charT>>(getloc())) == typeid(collate_byname<charT>)
```

and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```
template<class ForwardIterator>
  string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
```

8 *Returns*: A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [`first`, `last`). Returns an empty string if the character sequence is not a valid collating element.

```
template<class ForwardIterator>
  char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last, bool icase = false) const;
```

9 *Returns*: An unspecified value that represents the character classification named by the character sequence designated by the iterator range [`first`, `last`). If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.[218] The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.

10 *Remarks*: For `regex_traits<char>`, at least the narrow character names in Table 121 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 121 shall be recognized.

```
bool isctype(charT c, char_class_type f) const;
```

11 *Effects*: Determines if the character `c` is a member of the character classification represented by `f`.

12 *Returns*: Given the following function declaration:

```
  // for exposition only
  template<class C>
    ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in Table 121 is set, then the result is determined as if by:

```
ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
  return true;
} else if (c == ct.widen('_')) {
  charT w[1] = { ct.widen('w') };
  char_class_type x = lookup_classname(w, w+1);
  return (f&x) == x;
} else {
  return false;
}
```

[*Example 1*:

```
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
```

218) For example, if the parameter `icase` is `true` then `[[:lower:]]` is the same as `[[:alpha:]]`.

©ISO/IEC

```
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f);  // m == ctype_base::digit | ctype_base::upper
```

— *end example*]

[*Example 2*:

```
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f);  // returns true
t.isctype('_', f);  // returns true
t.isctype(' ', f);  // returns false
```

— *end example*]

```
int value(charT ch, int radix) const;
```

13 *Preconditions*: The value of `radix` is 8, 10, or 16.

14 *Returns*: The value represented by the digit `ch` in base `radix` if the character `ch` is a valid digit in base `radix`; otherwise returns `-1`.

```
locale_type imbue(locale_type loc);
```

15 *Effects*: Imbues `*this` with a copy of the locale `loc`.

[*Note 1*: Calling `imbue` with a different locale than the one currently in use invalidates all cached data held by `*this`. — *end note*]

16 *Postconditions*: `getloc() == loc`.

17 *Returns*: If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

```
locale_type getloc() const;
```

18 *Returns*: If no locale has been imbued then a copy of the global locale in effect at the time of construction of `*this`, otherwise a copy of the last argument passed to `imbue`.

Table 121 — Character class names and corresponding `ctype` masks **[tab:re.traits.classnames]**

Narrow character name	Wide character name	Corresponding `ctype_base::mask` value
`"alnum"`	`L"alnum"`	`ctype_base::alnum`
`"alpha"`	`L"alpha"`	`ctype_base::alpha`
`"blank"`	`L"blank"`	`ctype_base::blank`
`"cntrl"`	`L"cntrl"`	`ctype_base::cntrl`
`"digit"`	`L"digit"`	`ctype_base::digit`
`"d"`	`L"d"`	`ctype_base::digit`
`"graph"`	`L"graph"`	`ctype_base::graph`
`"lower"`	`L"lower"`	`ctype_base::lower`
`"print"`	`L"print"`	`ctype_base::print`
`"punct"`	`L"punct"`	`ctype_base::punct`
`"space"`	`L"space"`	`ctype_base::space`
`"s"`	`L"s"`	`ctype_base::space`
`"upper"`	`L"upper"`	`ctype_base::upper`
`"w"`	`L"w"`	`ctype_base::alnum`
`"xdigit"`	`L"xdigit"`	`ctype_base::xdigit`

28.6.7 Class template `basic_regex` [re.regex]

28.6.7.1 General [re.regex.general]

1 For a char-like type `charT`, specializations of class template `basic_regex` represent regular expressions constructed from character sequences of `charT` characters. In the rest of 28.6.7, `charT` denotes a given

char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class `basic_regex`.

2 Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[*Note 1*: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. — *end note*]

3 The functions described in 28.6.7 report errors by throwing exceptions of type `regex_error`.

```
namespace std {
  template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
    public:
      // types

  };

  template<class ForwardIterator>
    basic_regex(ForwardIterator, ForwardIterator,
                regex_constants::syntax_option_type = regex_constants::ECMAScript)
      -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;
}
```

28.6.7.2 Constructors [re.regex.construct]

`basic_regex();`

1 *Postconditions*: `*this` does not match any character sequence.

`explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);`

2 *Preconditions*: [`p`, `p + char_traits<charT>::length(p)`) is a valid range.

3 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [`p`, `p + char_traits<charT>::length(p)`), and interpreted according to the flags `f`.

4 *Postconditions*: `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

5 *Throws*: `regex_error` if [`p`, `p + char_traits<charT>::length(p)`) is not a valid regular expression.

`basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);`

6 *Preconditions*: [`p`, `p + len`) is a valid range.

7 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [`p`, `p + len`), and interpreted according the flags specified in `f`.

8 *Postconditions*: `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

9 *Throws*: `regex_error` if [`p`, `p + len`) is not a valid regular expression.

`basic_regex(const basic_regex& e);`

10 *Postconditions*: `flags()` and `mark_count()` return `e.flags()` and `e.mark_count()`, respectively.

`basic_regex(basic_regex&& e) noexcept;`

11 *Postconditions*: `flags()` and `mark_count()` return the values that `e.flags()` and `e.mark_count()`, respectively, had before construction.

```
template<class ST, class SA>
  explicit basic_regex(const basic_string<charT, ST, SA>& s,
                       flag_type f = regex_constants::ECMAScript);
```

12 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the string `s`, and interpreted according to the flags specified in `f`.

13 *Postconditions*: `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

14 *Throws*: `regex_error` if `s` is not a valid regular expression.

```
template<class ForwardIterator>
  basic_regex(ForwardIterator first, ForwardIterator last,
              flag_type f = regex_constants::ECMAScript);
```

15 *Effects*: The object's internal finite state machine is constructed from the regular expression contained in the sequence of characters [`first`, `last`), and interpreted according to the flags specified in `f`.

16 *Postconditions*: `flags()` returns `f`. `mark_count()` returns the number of marked sub-expressions within the expression.

17 *Throws*: `regex_error` if the sequence [`first`, `last`) is not a valid regular expression.

```
basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
```

18 *Effects*: Same as `basic_regex(il.begin(), il.end(), f)`.

28.6.7.3 Assignment [re.regex.assign]

```
basic_regex& operator=(const basic_regex& e);
```

1 *Postconditions*: `flags()` and `mark_count()` return `e.flags()` and `e.mark_count()`, respectively.

```
basic_regex& operator=(basic_regex&& e) noexcept;
```

2 *Postconditions*: `flags()` and `mark_count()` return the values that `e.flags()` and `e.mark_count()`, respectively, had before assignment. `e` is in a valid state with unspecified value.

```
basic_regex& operator=(const charT* p);
```

3 *Effects*: Equivalent to: `return assign(p);`

```
basic_regex& operator=(initializer_list<charT> il);
```

4 *Effects*: Equivalent to: `return assign(il.begin(), il.end());`

```
template<class ST, class SA>
  basic_regex& operator=(const basic_string<charT, ST, SA>& s);
```

5 *Effects*: Equivalent to: `return assign(s);`

```
basic_regex& assign(const basic_regex& e);
```

6 *Effects*: Equivalent to: `return *this = e;`

```
basic_regex& assign(basic_regex&& e) noexcept;
```

7 *Effects*: Equivalent to: `return *this = std::move(e);`

```
basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
```

8 *Effects*: Equivalent to: `return assign(string_type(p), f);`

```
basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
```

9 *Effects*: Equivalent to: `return assign(string_type(p, len), f);`

```
template<class ST, class SA>
  basic_regex& assign(const basic_string<charT, ST, SA>& s,
                      flag_type f = regex_constants::ECMAScript);
```

10 *Effects*: Assigns the regular expression contained in the string `s`, interpreted according the flags specified in `f`. If an exception is thrown, `*this` is unchanged.

11 *Postconditions*: If no exception is thrown, `flags()` returns `f` and `mark_count()` returns the number of marked sub-expressions within the expression.

12 *Returns*: `*this`.

13 *Throws*: `regex_error` if `s` is not a valid regular expression.

```
template<class InputIterator>
  basic_regex& assign(InputIterator first, InputIterator last,
                      flag_type f = regex_constants::ECMAScript);
```

14 *Effects*: Equivalent to: `return assign(string_type(first, last), f);`

```
basic_regex& assign(initializer_list<charT> il,
                    flag_type f = regex_constants::ECMAScript);
```

15 *Effects*: Equivalent to: `return assign(il.begin(), il.end(), f);`

28.6.7.4 Constant operations [re.regex.operations]

```
unsigned mark_count() const;
```

1 *Effects*: Returns the number of marked sub-expressions within the regular expression.

```
flag_type flags() const;
```

2 *Effects*: Returns a copy of the regular expression syntax flags that were passed to the object's constructor or to the last call to `assign`.

28.6.7.5 Locale [re.regex.locale]

```
locale_type imbue(locale_type loc);
```

1 *Effects*: Returns the result of `traits_inst.imbue(loc)` where `traits_inst` is a (default-initialized) instance of the template type argument `traits` stored within the object. After a call to `imbue` the `basic_regex` object does not match any character sequence.

```
locale_type getloc() const;
```

2 *Effects*: Returns the result of `traits_inst.getloc()` where `traits_inst` is a (default-initialized) instance of the template parameter `traits` stored within the object.

28.6.7.6 Swap [re.regex.swap]

```
void swap(basic_regex& e);
```

1 *Effects*: Swaps the contents of the two regular expressions.

2 *Postconditions*: `*this` contains the regular expression that was in `e`, `e` contains the regular expression that was in `*this`.

3 *Complexity*: Constant time.

28.6.7.7 Non-member functions [re.regex.nonmemb]

```
template<class charT, class traits>
  void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
```

1 *Effects*: Calls `lhs.swap(rhs)`.

28.6.8 Class template `sub_match` [re.submatch]

28.6.8.1 General [re.submatch.general]

1 Class template `sub_match` denotes the sequence of characters matched by a particular marked sub-expression.

```
namespace std {
  template<class BidirectionalIterator>
    class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
    public:
      using value_type      = iterator_traits<BidirectionalIterator>::value_type;
      using difference_type = iterator_traits<BidirectionalIterator>::difference_type;
      using iterator        = BidirectionalIterator;
      using string_type     = basic_string<value_type>;
```

```
    bool matched;

    constexpr sub_match();

    difference_type length() const;
    operator string_type() const;
    string_type str() const;

    int compare(const sub_match& s) const;
    int compare(const string_type& s) const;
    int compare(const value_type* s) const;

    void swap(sub_match& s) noexcept(see below);
  };
}
```

28.6.8.2 Members [re.submatch.members]

`constexpr sub_match();`

1 *Effects*: Value-initializes the `pair` base class subobject and the member `matched`.

`difference_type length() const;`

2 *Returns*: `matched ? distance(first, second) : 0`.

`operator string_type() const;`

3 *Returns*: `matched ? string_type(first, second) : string_type()`.

`string_type str() const;`

4 *Returns*: `matched ? string_type(first, second) : string_type()`.

`int compare(const sub_match& s) const;`

5 *Returns*: `str().compare(s.str())`.

`int compare(const string_type& s) const;`

6 *Returns*: `str().compare(s)`.

`int compare(const value_type* s) const;`

7 *Returns*: `str().compare(s)`.

`void swap(sub_match& s) noexcept(see below);`

8 *Preconditions*: `BidirectionalIterator` meets the *Cpp17Swappable* requirements (16.4.4.3).

9 *Effects*: Equivalent to:

```
this->pair<BidirectionalIterator, BidirectionalIterator>::swap(s);
std::swap(matched, s.matched);
```

10 *Remarks*: The exception specification is equivalent to `is_nothrow_swappable_v<BidirectionalIterator>`.

28.6.8.3 Non-member operators [re.submatch.op]

1 Let *SM-CAT*(`I`) be

```
compare_three_way_result_t<basic_string<typename iterator_traits<I>::value_type>>
```

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

2 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);
```

3 *Returns*: `static_cast<`*SM-CAT*`(BiIter)>(lhs.compare(rhs) <=> 0)`.

```
template<class BiIter, class ST, class SA>
  bool operator==(
      const sub_match<BiIter>& lhs,
      const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

4 *Returns*:

```
lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0
```

```
template<class BiIter, class ST, class SA>
  auto operator<=>(
      const sub_match<BiIter>& lhs,
      const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);
```

5 *Returns*:

```
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(rhs.data(), rhs.size()))
      <=> 0
    )
```

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type* rhs);
```

6 *Returns*: `lhs.compare(rhs) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs,
                   const typename iterator_traits<BiIter>::value_type* rhs);
```

7 *Returns*: `static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0)`.

```
template<class BiIter>
  bool operator==(const sub_match<BiIter>& lhs,
                  const typename iterator_traits<BiIter>::value_type& rhs);
```

8 *Returns*: `lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0`.

```
template<class BiIter>
  auto operator<=>(const sub_match<BiIter>& lhs,
                   const typename iterator_traits<BiIter>::value_type& rhs);
```

9 *Returns*:

```
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(1, rhs))
      <=> 0
    )
```

```
template<class charT, class ST, class BiIter>
  basic_ostream<charT, ST>&
    operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
```

10 *Returns*: `os << m.str()`.

28.6.9 Class template `match_results` [re.results]

28.6.9.1 General [re.results.general]

1 Class template `match_results` denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template `match_results`.

2 The class template `match_results` meets the requirements of an allocator-aware container (23.2.2.5) and of a sequence container (23.2.2, 23.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.

3 A default-constructed `match_results` object has no fully established result state. A match result is *ready* when, as a consequence of a completed regular expression match modifying such an object, its result state

becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.

4 The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters [`first`, `second`) which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched.

[*Note 1*: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — *end note*]

```
namespace std {
  template<class BidirectionalIterator,
           class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {
    public:
      using value_type      = sub_match<BidirectionalIterator>;
      using const_reference = const value_type&;
      using reference       = value_type&;
      using const_iterator  = implementation-defined;
      using iterator        = const_iterator;
      using difference_type = iterator_traits<BidirectionalIterator>::difference_type;
      using size_type       = allocator_traits<Allocator>::size_type;
      using allocator_type  = Allocator;
      using char_type       = iterator_traits<BidirectionalIterator>::value_type;
      using string_type     = basic_string<char_type>;

      // 28.6.9.2, construct/copy/destroy
      match_results() : match_results(Allocator()) {}
      explicit match_results(const Allocator& a);
      match_results(const match_results& m);
      match_results(const match_results& m, const Allocator& a);
      match_results(match_results&& m) noexcept;
      match_results(match_results&& m, const Allocator& a);
      match_results& operator=(const match_results& m);
      match_results& operator=(match_results&& m);
      ~match_results();

      // 28.6.9.3, state
      bool ready() const;

      // 28.6.9.4, size
      size_type size() const;
      size_type max_size() const;
      bool empty() const;

      // 28.6.9.5, element access
      difference_type length(size_type sub = 0) const;
      difference_type position(size_type sub = 0) const;
      string_type str(size_type sub = 0) const;
      const_reference operator[](size_type n) const;

      const_reference prefix() const;
      const_reference suffix() const;
      const_iterator begin() const;
      const_iterator end() const;
      const_iterator cbegin() const;
      const_iterator cend() const;

      // 28.6.9.6, format
      template<class OutputIter>
        OutputIter
          format(OutputIter out,
```

```
            const char_type* fmt_first, const char_type* fmt_last,
            regex_constants::match_flag_type flags = regex_constants::format_default) const;
    template<class OutputIter, class ST, class SA>
      OutputIter
        format(OutputIter out,
            const basic_string<char_type, ST, SA>& fmt,
            regex_constants::match_flag_type flags = regex_constants::format_default) const;
    template<class ST, class SA>
      basic_string<char_type, ST, SA>
        format(const basic_string<char_type, ST, SA>& fmt,
            regex_constants::match_flag_type flags = regex_constants::format_default) const;
    string_type
      format(const char_type* fmt,
          regex_constants::match_flag_type flags = regex_constants::format_default) const;

    // 28.6.9.7, allocator
    allocator_type get_allocator() const;

    // 28.6.9.8, swap
    void swap(match_results& that);
  };
}
```

28.6.9.2 Constructors [re.results.const]

1 Table 122 lists the postconditions of `match_results` copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter `m` denote the values they had before the respective function calls.

```
explicit match_results(const Allocator& a);
```

2 *Effects*: The stored `Allocator` value is constructed from `a`.

3 *Postconditions*: `ready()` returns `false`. `size()` returns `0`.

```
match_results(const match_results& m);
match_results(const match_results& m, const Allocator& a);
```

4 *Effects*: For the first form, the stored `Allocator` value is obtained as specified in 23.2.2.2. For the second form, the stored `Allocator` value is constructed from `a`.

5 *Postconditions*: As specified in Table 122.

```
match_results(match_results&& m) noexcept;
match_results(match_results&& m, const Allocator& a);
```

6 *Effects*: For the first form, the stored `Allocator` value is move constructed from `m.get_allocator()`. For the second form, the stored `Allocator` value is constructed from `a`.

7 *Postconditions*: As specified in Table 122.

8 *Throws*: The second form throws nothing if `a == m.get_allocator()` is `true`.

```
match_results& operator=(const match_results& m);
```

9 *Postconditions*: As specified in Table 122.

```
match_results& operator=(match_results&& m);
```

10 *Postconditions*: As specified in Table 122.

28.6.9.3 State [re.results.state]

```
bool ready() const;
```

1 *Returns*: `true` if `*this` has a fully established result state, otherwise `false`.

Table 122 — `match_results` copy/move operation postconditions [tab:re.results.const]

Element	Value
`ready()`	`m.ready()`
`size()`	`m.size()`
`str(n)`	`m.str(n)` for all non-negative integers `n < m.size()`
`prefix()`	`m.prefix()`
`suffix()`	`m.suffix()`
`(*this)[n]`	`m[n]` for all non-negative integers `n < m.size()`
`length(n)`	`m.length(n)` for all non-negative integers `n < m.size()`
`position(n)`	`m.position(n)` for all non-negative integers `n < m.size()`

28.6.9.4 Size [re.results.size]

```
size_type size() const;
```

1 *Returns*: One plus the number of marked sub-expressions in the regular expression that was matched if `*this` represents the result of a successful match. Otherwise returns `0`.

[*Note 1*: The state of a `match_results` object can be modified only by passing that object to `regex_match` or `regex_search`. Subclauses 28.6.10.2 and 28.6.10.3 specify the effects of those algorithms on their `match_results` arguments. — *end note*]

```
size_type max_size() const;
```

2 *Returns*: The maximum number of `sub_match` elements that can be stored in `*this`.

```
bool empty() const;
```

3 *Returns*: `size() == 0`.

28.6.9.5 Element access [re.results.acc]

```
difference_type length(size_type sub = 0) const;
```

1 *Preconditions*: `ready() == true`.

2 *Returns*: `(*this)[sub].length()`.

```
difference_type position(size_type sub = 0) const;
```

3 *Preconditions*: `ready() == true`.

4 *Returns*: The distance from the start of the target sequence to `(*this)[sub].first`.

```
string_type str(size_type sub = 0) const;
```

5 *Preconditions*: `ready() == true`.

6 *Returns*: `string_type((*this)[sub])`.

```
const_reference operator[](size_type n) const;
```

7 *Preconditions*: `ready() == true`.

8 *Returns*: A reference to the `sub_match` object representing the character sequence that matched marked sub-expression `n`. If `n == 0` then returns a reference to a `sub_match` object representing the character sequence that matched the whole regular expression. If `n >= size()` then returns a `sub_match` object representing an unmatched sub-expression.

```
const_reference prefix() const;
```

9 *Preconditions*: `ready() == true`.

10 *Returns*: A reference to the `sub_match` object representing the character sequence from the start of the string being matched/searched to the start of the match found.

```
const_reference suffix() const;
```

11 *Preconditions*: `ready() == true`.

12 *Returns*: A reference to the `sub_match` object representing the character sequence from the end of the match found to the end of the string being matched/searched.

```
const_iterator begin() const;
const_iterator cbegin() const;
```

13 *Returns*: A starting iterator that enumerates over all the sub-expressions stored in `*this`.

```
const_iterator end() const;
const_iterator cend() const;
```

14 *Returns*: A terminating iterator that enumerates over all the sub-expressions stored in `*this`.

28.6.9.6 Formatting [re.results.form]

```
template<class OutputIter>
  OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

1 *Preconditions*: `ready() == true` and `OutputIter` meets the requirements for a *Cpp17OutputIterator* (24.3.5.4).

2 *Effects*: Copies the character sequence [`fmt_first`, `fmt_last`) to OutputIter `out`. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within `*this` to which it refers. The bitmasks specified in `flags` determine which format specifiers and escape sequences are recognized.

3 *Returns*: `out`.

```
template<class OutputIter, class ST, class SA>
  OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

4 *Effects*: Equivalent to:

```
return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```
template<class ST, class SA>
  basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

5 *Preconditions*: `ready() == true`.

6 *Effects*: Constructs an empty string `result` of type `basic_string<char_type, ST, SA>` and calls:

```
format(back_inserter(result), fmt, flags);
```

7 *Returns*: `result`.

```
string_type format(
  const char_type* fmt,
  regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

8 *Preconditions*: `ready() == true`.

9 *Effects*: Constructs an empty string `result` of type `string_type` and calls:

```
format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
```

10 *Returns*: `result`.

28.6.9.7 Allocator [re.results.all]

```
allocator_type get_allocator() const;
```

1 *Returns*: A copy of the Allocator that was passed to the object's constructor or, if that allocator has been replaced, a copy of the most recent replacement.

28.6.9.8 Swap [re.results.swap]

```
void swap(match_results& that);
```

1 *Effects*: Swaps the contents of the two sequences.

2 *Postconditions*: `*this` contains the sequence of matched sub-expressions that were in `that`, `that` contains the sequence of matched sub-expressions that were in `*this`.

3 *Complexity*: Constant time.

```
template<class BidirectionalIterator, class Allocator>
  void swap(match_results<BidirectionalIterator, Allocator>& m1,
            match_results<BidirectionalIterator, Allocator>& m2);
```

4 *Effects*: As if by `m1.swap(m2)`.

28.6.9.9 Non-member functions [re.results.nonmember]

```
template<class BidirectionalIterator, class Allocator>
  bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
                  const match_results<BidirectionalIterator, Allocator>& m2);
```

1 *Returns*: `true` if neither match result is ready, `false` if one match result is ready and the other is not. If both match results are ready, returns `true` only if

(1.1) — `m1.empty() && m2.empty()`, or

(1.2) — `!m1.empty() && !m2.empty()`, and the following conditions are satisfied:

(1.2.1) — `m1.prefix() == m2.prefix()`,

(1.2.2) — `m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin())`, and

(1.2.3) — `m1.suffix() == m2.suffix()`.

[*Note 1*: The algorithm `equal` is defined in Clause 26. — *end note*]

28.6.10 Regular expression algorithms [re.alg]

28.6.10.1 Exceptions [re.except]

1 The algorithms described in subclause 28.6.10 may throw an exception of type `regex_error`. If such an exception `e` is thrown, `e.code()` shall return either `regex_constants::error_complexity` or `regex_constants::error_stack`.

28.6.10.2 `regex_match` [re.alg.match]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
  bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                   match_results<BidirectionalIterator, Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions*: `BidirectionalIterator` models `bidirectional_iterator` (24.3.4.12).

2 *Effects*: Determines whether there is a match between the regular expression `e`, and all of the character sequence [`first`, `last`). The parameter `flags` is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns `true` if such a match exists, `false` otherwise.

[*Example 1*:

```
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re);        // returns true, and m[0] contains "Get"
regex_match ("GetValue", m, re);        // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re);       // returns true, and m[0] contains "Get"
```

```
regex_match ("GetValues", m, re);        // returns false
```

— *end example*]

3 *Postconditions*: `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns `0` and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 123.

Table 123 — Effects of `regex_match` algorithm [tab:re.alg.match]

Element	Value
`m.size()`	`1 + e.mark_count()`
`m.empty()`	`false`
`m.prefix().first`	`first`
`m.prefix().second`	`first`
`m.prefix().matched`	`false`
`m.suffix().first`	`last`
`m.suffix().second`	`last`
`m.suffix().matched`	`false`
`m[0].first`	`first`
`m[0].second`	`last`
`m[0].matched`	`true`
`m[n].first`	For all integers `0 < n < m.size()`, the start of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].second`	For all integers `0 < n < m.size()`, the end of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].matched`	For all integers `0 < n < m.size()`, `true` if sub-expression `n` participated in the match, `false` otherwise.

```
template<class BidirectionalIterator, class charT, class traits>
  bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

4 *Effects*: Behaves "as if" by constructing an instance of `match_results<BidirectionalIterator> what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```
template<class charT, class Allocator, class traits>
  bool regex_match(const charT* str,
                   match_results<const charT*, Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Returns*: `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```
template<class ST, class SA, class Allocator, class charT, class traits>
  bool regex_match(const basic_string<charT, ST, SA>& s,
                   match_results<typename basic_string<charT, ST, SA>::const_iterator,
                                 Allocator>& m,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

6 *Returns*: `regex_match(s.begin(), s.end(), m, e, flags)`.

```
template<class charT, class traits>
  bool regex_match(const charT* str,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

7 *Returns*: `regex_match(str, str + char_traits<charT>::length(str), e, flags)`.

```
template<class ST, class SA, class charT, class traits>
  bool regex_match(const basic_string<charT, ST, SA>& s,
                   const basic_regex<charT, traits>& e,
                   regex_constants::match_flag_type flags = regex_constants::match_default);
```

8 *Returns*: `regex_match(s.begin(), s.end(), e, flags)`.

28.6.10.3 `regex_search` [re.alg.search]

```
template<class BidirectionalIterator, class Allocator, class charT, class traits>
  bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                    match_results<BidirectionalIterator, Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Preconditions*: `BidirectionalIterator` models `bidirectional_iterator` (24.3.4.12).

2 *Effects*: Determines whether there is some sub-sequence within [`first`, `last`) that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

3 *Postconditions*: `m.ready() == true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns `0` and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 124.

Table 124 — Effects of `regex_search` algorithm [tab:re.alg.search]

Element	Value
`m.size()`	`1 + e.mark_count()`
`m.empty()`	`false`
`m.prefix().first`	`first`
`m.prefix().second`	`m[0].first`
`m.prefix().matched`	`m.prefix().first != m.prefix().second`
`m.suffix().first`	`m[0].second`
`m.suffix().second`	`last`
`m.suffix().matched`	`m.suffix().first != m.suffix().second`
`m[0].first`	The start of the sequence of characters that matched the regular expression
`m[0].second`	The end of the sequence of characters that matched the regular expression
`m[0].matched`	`true`
`m[n].first`	For all integers `0 < n < m.size()`, the start of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].second`	For all integers `0 < n < m.size()`, the end of the sequence that matched sub-expression `n`. Alternatively, if sub-expression `n` did not participate in the match, then `last`.
`m[n].matched`	For all integers `0 < n < m.size()`, `true` if sub-expression `n` participated in the match, `false` otherwise.

```
template<class charT, class Allocator, class traits>
  bool regex_search(const charT* str, match_results<const charT*, Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

4 *Returns*: `regex_search(str, str + char_traits<charT>::length(str), m, e, flags)`.

```
template<class ST, class SA, class Allocator, class charT, class traits>
  bool regex_search(const basic_string<charT, ST, SA>& s,
                    match_results<typename basic_string<charT, ST, SA>::const_iterator,
                                  Allocator>& m,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Returns*: `regex_search(s.begin(), s.end(), m, e, flags)`.

```
template<class BidirectionalIterator, class charT, class traits>
  bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

6 *Effects*: Behaves "as if" by constructing an object `what` of type `match_results<BidirectionalIterator>` and returning `regex_search(first, last, what, e, flags)`.

```
template<class charT, class traits>
  bool regex_search(const charT* str,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

7 *Returns*: `regex_search(str, str + char_traits<charT>::length(str), e, flags)`.

```
template<class ST, class SA, class charT, class traits>
  bool regex_search(const basic_string<charT, ST, SA>& s,
                    const basic_regex<charT, traits>& e,
                    regex_constants::match_flag_type flags = regex_constants::match_default);
```

8 *Returns*: `regex_search(s.begin(), s.end(), e, flags)`.

28.6.10.4 `regex_replace` [re.alg.replace]

```
template<class OutputIterator, class BidirectionalIterator,
         class traits, class charT, class ST, class SA>
  OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
  OutputIterator
    regex_replace(OutputIterator out,
                  BidirectionalIterator first, BidirectionalIterator last,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 *Effects*: Constructs a `regex_iterator` object `i` as if by

```
regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)
```

and uses `i` to enumerate through all of the matches `m` of type `match_results<BidirectionalIterator>` that occur within the sequence [`first`, `last`). If no such matches are found and `!(flags & regex_constants::format_no_copy)`, then calls

```
out = copy(first, last, out)
```

If any matches are found then, for each such match:

(1.1) — If `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(m.prefix().first, m.prefix().second, out)
```

(1.2) — Then calls

```
out = m.format(out, fmt, flags)
```

for the first form of the function and

```
out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)
```

for the second.

Finally, if such a match is found and `!(flags & regex_constants::format_no_copy)`, calls

```
out = copy(last_m.suffix().first, last_m.suffix().second, out)
```

where `last_m` is a copy of the last match found. If `flags & regex_constants::format_first_only` is nonzero, then only the first match found is replaced.

2 *Returns*: `out`.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
  basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, FST, FSA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT, class ST, class SA>
  basic_string<charT, ST, SA>
    regex_replace(const basic_string<charT, ST, SA>& s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

3 *Effects*: Constructs an empty string `result` of type `basic_string<charT, ST, SA>` and calls:

```
regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);
```

4 *Returns*: `result`.

```
template<class traits, class charT, class ST, class SA>
  basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const basic_string<charT, ST, SA>& fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
template<class traits, class charT>
  basic_string<charT>
    regex_replace(const charT* s,
                  const basic_regex<charT, traits>& e,
                  const charT* fmt,
                  regex_constants::match_flag_type flags = regex_constants::match_default);
```

5 *Effects*: Constructs an empty string `result` of type `basic_string<charT>` and calls:

```
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);
```

6 *Returns*: `result`.

28.6.11 Regular expression iterators [re.iter]

28.6.11.1 Class template `regex_iterator` [re.regiter]

28.6.11.1.1 General [re.regiter.general]

1 The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
    class regex_iterator {
    public:
      using regex_type        = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using iterator_concept  = input_iterator_tag;
      using value_type        = match_results<BidirectionalIterator>;
      using difference_type   = ptrdiff_t;
      using pointer           = const value_type*;
      using reference         = const value_type&;

      regex_iterator();
      regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     regex_constants::match_flag_type m = regex_constants::match_default);
      regex_iterator(BidirectionalIterator, BidirectionalIterator,
                     const regex_type&&,
                     regex_constants::match_flag_type = regex_constants::match_default) = delete;
      regex_iterator(const regex_iterator&);
      regex_iterator& operator=(const regex_iterator&);
      bool operator==(const regex_iterator&) const;
      bool operator==(default_sentinel_t) const { return *this == regex_iterator(); }
      const value_type& operator*() const;
      const value_type* operator->() const;
      regex_iterator& operator++();
      regex_iterator operator++(int);

    private:
      BidirectionalIterator               begin;    // exposition only
      BidirectionalIterator               end;      // exposition only
      const regex_type*                   pregex;   // exposition only
      regex_constants::match_flag_type    flags;    // exposition only
      match_results<BidirectionalIterator> match;   // exposition only
    };
}
```

2 An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

[*Note 1*: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as `'^'`, `'$'`, `'\b'`, `'\B'`). — *end note*]

28.6.11.1.2 Constructors [re.regiter.cnstr]

```
regex_iterator();
```

1 *Effects*: Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
               const regex_type& re,
               regex_constants::match_flag_type m = regex_constants::match_default);
```

2 *Effects*: Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

28.6.11.1.3 Comparisons [re.regiter.comp]

```
bool operator==(const regex_iterator& right) const;
```

1 *Returns*: `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

(1.1) — `begin == right.begin`,

(1.2) — `end == right.end`,

(1.3) — `pregex == right.pregex`,

(1.4) — `flags == right.flags`, and

(1.5) — `match[0] == right.match[0]`;

otherwise `false`.

28.6.11.1.4 Indirection [re.regiter.deref]

```
const value_type& operator*() const;
```

1 *Returns*: `match`.

```
const value_type* operator->() const;
```

2 *Returns*: `addressof(match)`.

28.6.11.1.5 Increment [re.regiter.incr]

```
regex_iterator& operator++();
```

1 *Effects*: Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.

2 If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

3 Otherwise, if the iterator holds a zero-length match, the operator calls:

```
regex_search(start, end, match, *pregex,
             flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.

4 If the most recent match was not a zero-length match, the operator sets `flags` to `flags | regex_constants::match_prev_avail` and calls `regex_search(start, end, match, *pregex, flags)`. If the call returns `false` the iterator sets `*this` to the end-of-sequence iterator. The iterator then returns `*this`.

5 In all cases in which the call to `regex_search` returns `true`, `match.prefix().first` shall be equal to the previous value of `match[0].second`, and for each index `i` in the half-open range `[0,match.size())` for which `match[i].matched` is `true`, `match.position(i)` shall return `distance(begin, match[i].first)`.

6 [*Note 1*: This means that `match.position(i)` gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to `regex_search`. — *end note*]

7 It is unspecified how the implementation makes these adjustments.

8 [*Note 2*: This means that an implementation can call an implementation-specific search function, in which case a program-defined specialization of `regex_search` will not be called. — *end note*]

```
regex_iterator operator++(int);
```

9 *Effects*: As if by:

```
regex_iterator tmp = *this;
++(*this);
return tmp;
```

28.6.11.2 Class template `regex_token_iterator` [re.tokiter]

28.6.11.2.1 General [re.tokiter.general]

1 The class template `regex_token_iterator` is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a `sub_match` class template instance that represents what matched a particular sub-expression within the regular expression.

[2] When class `regex_token_iterator` is used to enumerate a single sub-expression with index −1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

[3] After it is constructed, the iterator finds and stores a value `regex_iterator<BidirectionalIterator> position` and sets the internal count `N` to zero. It also maintains a sequence `subs` which contains a list of the sub-expressions which will be enumerated. Every time `operator++` is used the count `N` is incremented; if `N` exceeds or equals `subs.size()`, then the iterator increments member `position` and sets count `N` to zero.

[4] If the end of sequence is reached (`position` is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index −1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

[5] The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const sub_match<BidirectionalIterator>*` is returned.

[6] It is impossible to store things into `regex_token_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```
namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
    class regex_token_iterator {
    public:
      using regex_type        = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using iterator_concept  = input_iterator_tag;
      using value_type        = sub_match<BidirectionalIterator>;
      using difference_type   = ptrdiff_t;
      using pointer           = const value_type*;
      using reference         = const value_type&;

                         const regex_type&& re,
                         const int (&submatches)[N],
                         regex_constants::match_flag_type m =
                           regex_constants::match_default) = delete;
    regex_token_iterator(const regex_token_iterator&);
    regex_token_iterator& operator=(const regex_token_iterator&);
    bool operator==(const regex_token_iterator&) const;
    bool operator==(default_sentinel_t) const { return *this == regex_token_iterator(); }
    const value_type& operator*() const;
    const value_type* operator->() const;
    regex_token_iterator& operator++();
    regex_token_iterator operator++(int);

  private:
    using position_iterator =
      regex_iterator<BidirectionalIterator, charT, traits>;   // exposition only
    position_iterator position;                               // exposition only
    const value_type* result;                                 // exposition only
    value_type suffix;                                        // exposition only
    size_t N;                                                 // exposition only
    vector<int> subs;                                         // exposition only
  };
}
```

7 A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.matched` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.

8 [*Note 1*: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence. — *end note*]

9 The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

28.6.11.2.2 Constructors [re.tokiter.cnstr]

```
regex_token_iterator();
```

1 *Effects*: Constructs the end-of-sequence iterator.

```
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     int submatch = 0,
                     regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     const vector<int>& submatches,
                     regex_constants::match_flag_type m = regex_constants::match_default);
```

```
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                     const regex_type& re,
                     initializer_list<int> submatches,
                     regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
  regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
                       const regex_type& re,
                       const int (&submatches)[N],
                       regex_constants::match_flag_type m = regex_constants::match_default);
```

2 *Preconditions*: Each of the initialization values of `submatches` is `>= -1`.

3 *Effects*: The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range [`begin(submatches)`, `end(submatches)`).

4 Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to −1 the constructor sets `*this` to a suffix iterator that points to the range [`a`, `b`), otherwise the constructor sets `*this` to an end-of-sequence iterator.

28.6.11.2.3 Comparisons [re.tokiter.comp]

```
bool operator==(const regex_token_iterator& right) const;
```

1 *Returns*: `true` if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns `false` if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns `true` if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns `false`.

28.6.11.2.4 Indirection [re.tokiter.deref]

```
const value_type& operator*() const;
```

1 *Returns*: `*result`.

```
const value_type* operator->() const;
```

2 *Returns*: `result`.

28.6.11.2.5 Increment [re.tokiter.incr]

```
regex_token_iterator& operator++();
```

1 *Effects*: Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.

2 If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.

3 Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.

4 Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

5 Otherwise, if any of the values stored in `subs` is equal to −1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range [`prev->suffix().first`, `prev->suffix().second`).

6 Otherwise, sets `*this` to an end-of-sequence iterator.

7 *Returns*: `*this`.

```
regex_token_iterator& operator++(int);
```

8 *Effects*: Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

9 *Returns*: `tmp`.

28.6.12 Modified ECMAScript regular expression grammar [re.grammar]

1 The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

2 Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

3 The following productions within the ECMAScript grammar are modified as follows:

ClassAtom ::
`-`
ClassAtomNoDash
ClassAtomExClass
ClassAtomCollatingElement
ClassAtomEquivalence

IdentityEscape ::
SourceCharacter **but not** `c`

4 The following new productions are then added:

ClassAtomExClass ::
`[:` *ClassName* `:]`

ClassAtomCollatingElement ::
`[.` *ClassName* `.]`

ClassAtomEquivalence ::
`[=` *ClassName* `=]`

ClassName ::
ClassNameCharacter
ClassNameCharacter ClassName

ClassNameCharacter ::
SourceCharacter **but not one of** `.` **or** `=` **or** `:`

5 The productions *ClassAtomExClass*, *ClassAtomCollatingElement* and *ClassAtomEquivalence* provide functionality equivalent to that of the same features in regular expressions in POSIX.

6 The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 118.

7 A *ClassName* production, when used in *ClassAtomExClass*, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid *ClassName*s are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

`\d` and `[[:digit:]]`

`\D` and `[^[:digit:]]`

`\s` and `[[:space:]]`

`\S` and `[^[:space:]]`

`\w` and `[_[:alnum:]]`

`\W` and `[^_[:alnum:]]`

8 A *ClassName* production when used in a *ClassAtomCollatingElement* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.

9 The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR'ed together and subsequently passed to `traits_inst.isctype`.

10 A *ClassName* production when used in a *ClassAtomEquivalence* production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

11 When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

12 If the *CV* of a *UnicodeEscapeSequence* is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[*Note 1*: This means that values of the form `"\uxxxx"` that do not fit in a character are invalid. — *end note*]

13 Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

14 The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (28.6.4.3) specified when using the regular expression object in one of the regular expression algorithms (28.6.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:

(14.1.1) — if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;

(14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;

(14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is `false` then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```
string_type str1 = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
  flags() & icase ?
    traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
      <= traits_inst.transform(str.begin(), str.end())
  && traits_inst.transform(str.begin(), str.end())
      <= traits_inst.transform(str2.begin(), str2.end());
```

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using `traits::transform_primary`, and then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a character `c` is a member of a character class designated by an iterator range [`first`, `last`) if `traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase))` is `true`.

  size_t wcsxfrm(wchar_t* s1, const wchar_t* s2, size_t n);
  int wmemcmp(const wchar_t* s1, const wchar_t* s2, size_t n);              // freestanding
  const wchar_t* wcschr(const wchar_t* s, wchar_t c);                       // freestanding; see 16.2
  wchar_t* wcschr(wchar_t* s, wchar_t c);                                   // freestanding; see 16.2
  size_t wcscspn(const wchar_t* s1, const wchar_t* s2);                     // freestanding
  const wchar_t* wcspbrk(const wchar_t* s1, const wchar_t* s2);             // freestanding; see 16.2
  wchar_t* wcspbrk(wchar_t* s1, const wchar_t* s2);                         // freestanding; see 16.2
  const wchar_t* wcsrchr(const wchar_t* s, wchar_t c);                      // freestanding; see 16.2
  wchar_t* wcsrchr(wchar_t* s, wchar_t c);                                  // freestanding; see 16.2
  size_t wcsspn(const wchar_t* s1, const wchar_t* s2);                      // freestanding
  const wchar_t* wcsstr(const wchar_t* s1, const wchar_t* s2);              // freestanding; see 16.2
  wchar_t* wcsstr(wchar_t* s1, const wchar_t* s2);                          // freestanding; see 16.2
  wchar_t* wcstok(wchar_t* s1, const wchar_t* s2, wchar_t** ptr);           // freestanding
  const wchar_t* wmemchr(const wchar_t* s, wchar_t c, size_t n);            // freestanding; see 16.2
  wchar_t* wmemchr(wchar_t* s, wchar_t c, size_t n);                        // freestanding; see 16.2
  size_t wcslen(const wchar_t* s);                                          // freestanding
  wchar_t* wmemset(wchar_t* s, wchar_t c, size_t n);                        // freestanding
  size_t wcsftime(wchar_t* s, size_t maxsize, const wchar_t* format, const tm* timeptr);
  wint_t btowc(int c);
  int wctob(wint_t c);

  // 28.7.5, multibyte / wide string and character conversion functions
  int mbsinit(const mbstate_t* ps);
  size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
  size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
  size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
  size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
  size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
}
```

```
#define NULL see 17.2.3                                  // freestanding
#define WCHAR_MAX see below                              // freestanding
#define WCHAR_MIN see below                              // freestanding
#define WEOF see below                                   // freestanding
#define WCHAR_WIDTH see below                            // freestanding
```

1 The contents and meaning of the header `<cwchar>` are the same as the C standard library header `<wchar.h>`, except that it does not declare a type `wchar_t`.

2 [*Note 1*: The functions `wcschr`, `wcspbrk`, `wcsrchr`, `wcsstr`, and `wmemchr` have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

See also: ISO/IEC 9899:2024, 7.31

28.7.4 Header <cuchar> synopsis [cuchar.syn]

```
#define __STDC_VERSION_UCHAR_H__ 202311L

namespace std {
  using mbstate_t = see below;
  using size_t = see 17.2.4;

  size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
  size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
  size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
  size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
  size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
  size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}
```

1 The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it does not declare types `char8_t`, `char16_t`, or `char32_t`.

See also: ISO/IEC 9899:2024, 7.30

28.7.5 Multibyte / wide string and character conversion functions [c.mb.wcs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2), `<cuchar>` (28.7.4), and `<cwchar>` (28.7.3) declare the functions described in this subclause. — *end note*]

```
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

2 *Effects*: These functions have the semantics specified in the C standard library.

See also: ISO/IEC 9899:2024, 7.24.8.2, 7.24.9, 7.31.6.3.1

```
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

3 *Effects*: These functions have the semantics specified in the C standard library.

4 *Remarks*: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO/IEC 9899:2024, 7.24.8

```
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
```

```
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

5 *Effects*: These functions have the semantics specified in the C standard library.

6 *Remarks*: Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

29 Numerics library [numerics]

29.1 General [numerics.general]

1 This Clause describes components that C++ programs may use to perform seminumerical operations.

2 The following subclauses describe components for complex number types, random number generation, numeric (*n*-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 125.

Table 125 — Numerics library summary [tab:numerics.summary]

	Subclause	Header
29.2	Requirements	
29.3	Floating-point environment	`<cfenv>`
29.4	Complex numbers	`<complex>`
29.5	Random number generation	`<random>`
29.6	Numeric arrays	`<valarray>`
29.7	Mathematical functions for floating-point types	`<cmath>`, `<cstdlib>`
29.8	Numbers	`<numbers>`
29.9	Linear algebra	`<linalg>`
29.10	Data-parallel types	`<simd>`

29.2 Numeric type requirements [numeric.requirements]

1 The `complex` and `valarray` components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A *numeric type* is a cv-unqualified object type `T` that meets the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, and *Cpp17Destructible* requirements (16.4.4.2).[219]

2 If any operation on `T` throws an exception the effects are undefined.

3 In addition, many member and related functions of `valarray<T>` can be successfully instantiated and will exhibit well-defined behavior if and only if `T` meets additional requirements specified for each such member or related function.

4 [*Example 1*: It is valid to instantiate `valarray<complex>`, but `operator>()` will not be successfully instantiated for `valarray<complex>` operands, since `complex` does not have any ordering operators. — *end example*]

29.3 The floating-point environment [cfenv]

29.3.1 Header `<cfenv>` synopsis [cfenv.syn]

```
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below    // optional
#define FE_INEXACT see below      // optional
#define FE_INVALID see below      // optional
#define FE_OVERFLOW see below     // optional
#define FE_UNDERFLOW see below    // optional

#define FE_DOWNWARD see below     // optional
#define FE_TONEAREST see below    // optional
#define FE_TOWARDZERO see below   // optional
#define FE_UPWARD see below       // optional

#define FE_DFL_ENV see below
```

219) In other words, value types. These include arithmetic types, pointers, the library class `complex`, and specializations of `valarray` for value types.

```
namespace std {
  // types
  using fenv_t   = object type;
  using fexcept_t = object type;

  // functions
  int feclearexcept(int except);
  int fegetexceptflag(fexcept_t* pflag, int except);
  int feraiseexcept(int except);
  int fesetexceptflag(const fexcept_t* pflag, int except);
  int fetestexcept(int except);

  int fegetround();
  int fesetround(int mode);

  int fegetenv(fenv_t* penv);
  int feholdexcept(fenv_t* penv);
  int fesetenv(const fenv_t* penv);
  int feupdateenv(const fenv_t* penv);
}
```

1 The contents and meaning of the header `<cfenv>` are a subset of the C standard library header `<fenv.h>` and only the declarations shown in the synopsis above are present.

[*Note 1*: This document does not require an implementation to support the `FENV_ACCESS` pragma; it is implementation-defined (15.10) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — *end note*]

See also: ISO/IEC 9899:2024, 7.6

29.3.2 Threads [cfenv.thread]

1 The floating-point environment has thread storage duration (6.8.6.3). The initial state for a thread's floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding `thread` object (32.4.3) or `jthread` object (32.4.4) at the time it constructed the object.

[*Note 1*: That is, the child thread gets the floating-point state of the parent thread at the time of the child's creation. — *end note*]

2 A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

29.4 Complex numbers [complex.numbers]

29.4.1 General [complex.numbers.general]

1 The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the primary template of `complex` for any type that is not a cv-unqualified floating-point type (6.9.2) is unspecified. Specializations of `complex` for cv-unqualified floating-point types are trivially copyable literal types (6.9.1).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If `z` is an lvalue of type *cv* `complex<T>` then:

(4.1) — the expression `reinterpret_cast<`*cv* `T(&)[2]>(z)` is well-formed,

(4.2) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[0]` designates the real part of `z`, and

(4.3) — `reinterpret_cast<`*cv* `T(&)[2]>(z)[1]` designates the imaginary part of `z`.

Moreover, if `a` is an expression of type *cv* `complex<T>*` and the expression `a[i]` is well-defined for an integer expression `i`, then:

(4.4) — `reinterpret_cast<`*cv* `T*>(a)[2 * i]` designates the real part of `a[i]`, and

(4.5) — `reinterpret_cast<`*cv* `T*>(a)[2 * i + 1]` designates the imaginary part of `a[i]`.

29.4.2 Header <complex> synopsis [complex.syn]

```
namespace std {
  // 29.4.3, class template complex
  template<class T> class complex;

  // 29.4.6, operators
  template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);

  template<class T> constexpr complex<T> operator-(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator-(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator-(const T&, const complex<T>&);

  template<class T> constexpr complex<T> operator*(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator*(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator*(const T&, const complex<T>&);

  template<class T> constexpr complex<T> operator/(const complex<T>&, const complex<T>&);
  template<class T> constexpr complex<T> operator/(const complex<T>&, const T&);
  template<class T> constexpr complex<T> operator/(const T&, const complex<T>&);

  template<class T> constexpr complex<T> operator+(const complex<T>&);
  template<class T> constexpr complex<T> operator-(const complex<T>&);

  template<size_t I, class T> struct tuple_element;
  template<class T> struct tuple_size<complex<T>>;
  template<size_t I, class T> struct tuple_element<I, complex<T>>;
  template<size_t I, class T>
    constexpr T& get(complex<T>&) noexcept;
  template<size_t I, class T>
    constexpr T&& get(complex<T>&&) noexcept;
  template<size_t I, class T>
    constexpr const T& get(const complex<T>&) noexcept;
  template<size_t I, class T>
    constexpr const T&& get(const complex<T>&&) noexcept;

  // 29.4.11, complex literals
  inline namespace literals {
    inline namespace complex_literals {
      constexpr complex<long double> operator""il(long double);
      constexpr complex<long double> operator""il(unsigned long long);
      constexpr complex<double> operator""i(long double);
      constexpr complex<double> operator""i(unsigned long long);
      constexpr complex<float> operator""if(long double);
      constexpr complex<float> operator""if(unsigned long long);
    }
  }
}
```

29.4.3 Class template complex [complex]

```
namespace std {
  template<class T> class complex {
  public:
    using value_type = T;

    constexpr complex(const T& re = T(), const T& im = T());
    constexpr complex(const complex&) = default;
    template<class X> constexpr explicit(see below) complex(const complex<X>&);

    constexpr T real() const;
    constexpr void real(T);
    constexpr T imag() const;
    constexpr void imag(T);

    constexpr complex& operator= (const T&);
    constexpr complex& operator+=(const T&);
    constexpr complex& operator-=(const T&);
    constexpr complex& operator*=(const T&);
    constexpr complex& operator/=(const T&);

    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator= (const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);
  };
}
```

1 The class `complex` describes an object that can store the Cartesian components, `real()` and `imag()`, of a complex number.

29.4.4 Member functions [complex.members]

```
constexpr complex(const T& re = T(), const T& im = T());
```

1 *Postconditions*: `real() == re && imag() == im` is `true`.

```
template<class X> constexpr explicit(see below) complex(const complex<X>& other);
```

2 *Effects*: Initializes the real part with `other.real()` and the imaginary part with `other.imag()`.

3 *Remarks*: The expression inside `explicit` evaluates to `false` if and only if the floating-point conversion rank of `T` is greater than or equal to the floating-point conversion rank of `X`.

```
constexpr T real() const;
```

4 *Returns*: The value of the real component.

```
constexpr void real(T val);
```

5 *Effects*: Assigns `val` to the real component.

```
constexpr T imag() const;
```

6 *Returns*: The value of the imaginary component.

```
constexpr void imag(T val);
```

7 *Effects*: Assigns `val` to the imaginary component.

29.4.5 Member operators [complex.member.ops]

```
constexpr complex& operator+=(const T& rhs);
```

1 *Effects*: Adds the scalar value `rhs` to the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

2 *Returns*: `*this`.

```
constexpr complex& operator-=(const T& rhs);
```

3 *Effects*: Subtracts the scalar value `rhs` from the real part of the complex value `*this` and stores the result in the real part of `*this`, leaving the imaginary part unchanged.

4 *Returns*: `*this`.

```
constexpr complex& operator*=(const T& rhs);
```

5 *Effects*: Multiplies the scalar value `rhs` by the complex value `*this` and stores the result in `*this`.

6 *Returns*: `*this`.

```
constexpr complex& operator/=(const T& rhs);
```

7 *Effects*: Divides the scalar value `rhs` into the complex value `*this` and stores the result in `*this`.

8 *Returns*: `*this`.

```
template<class X> constexpr complex& operator=(const complex<X>& rhs);
```

9 *Effects*: Assigns the value `rhs.real()` to the real part and the value `rhs.imag()` to the imaginary part of the complex value `*this`.

10 *Returns*: `*this`.

```
template<class X> constexpr complex& operator+=(const complex<X>& rhs);
```

11 *Effects*: Adds the complex value `rhs` to the complex value `*this` and stores the sum in `*this`.

12 *Returns*: `*this`.

```
template<class X> constexpr complex& operator-=(const complex<X>& rhs);
```

13 *Effects*: Subtracts the complex value `rhs` from the complex value `*this` and stores the difference in `*this`.

14 *Returns*: `*this`.

```
template<class X> constexpr complex& operator*=(const complex<X>& rhs);
```

15 *Effects*: Multiplies the complex value `rhs` by the complex value `*this` and stores the product in `*this`.

16 *Returns*: `*this`.

```
template<class X> constexpr complex& operator/=(const complex<X>& rhs);
```

17 *Effects*: Divides the complex value `rhs` into the complex value `*this` and stores the quotient in `*this`.

18 *Returns*: `*this`.

29.4.6 Non-member operations [complex.ops]

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
```

1 *Returns*: `complex<T>(lhs)`.

```
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
```

2 *Returns*: `complex<T>(lhs) += rhs`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);
```

3 *Returns*: `complex<T>(-lhs.real(),-lhs.imag())`.

```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);
```

4 *Returns*: `complex<T>(lhs) -= rhs`.

```
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);
```

5 *Returns*: `complex<T>(lhs) *= rhs`.

```
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator/(const T& lhs, const complex<T>& rhs);
```

6 *Returns*: `complex<T>(lhs) /= rhs`.

```
template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
```

7 *Returns*: `lhs.real() == rhs.real() && lhs.imag() == rhs.imag()`.

8 *Remarks*: The imaginary part is assumed to be `T()`, or 0.0, for the `T` arguments.

```
template<class T, class charT, class traits>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);
```

9 *Preconditions*: The input values are convertible to `T`.

10 *Effects*: Extracts a complex number `x` of the form: `u`, `(u)`, or `(u,v)`, where `u` is the real part and `v` is the imaginary part (31.7.5.3).

11 If bad input is encountered, calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

12 *Returns*: `is`.

13 *Remarks*: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

```
template<class T, class charT, class traits>
  basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);
```

14 *Effects*: Inserts the complex number `x` onto the stream `o` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << ',' << x.imag() << ')';
return o << s.str();
```

[*Note 1*: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting `showpoint` into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — *end note*]

29.4.7 Value operations [complex.value.ops]

```
template<class T> constexpr T real(const complex<T>& x);
```

Returns: `x.real()`.

```
template<class T> constexpr T imag(const complex<T>& x);
```

Returns: `x.imag()`.

```
template<class T> constexpr T abs(const complex<T>& x);
```

Returns: The magnitude of `x`.

```
template<class T> constexpr T arg(const complex<T>& x);
```

Returns: The phase angle of `x`, or `atan2(imag(x), real(x))`.

```
template<class T> constexpr T norm(const complex<T>& x);
```

Returns: The squared magnitude of `x`.

```
template<class T> constexpr complex<T> conj(const complex<T>& x);
```

Returns: The complex conjugate of `x`.

```
template<class T> constexpr complex<T> proj(const complex<T>& x);
```

Returns: The projection of `x` onto the Riemann sphere.

Remarks: Behaves the same as the C function `cproj`. See also: ISO/IEC 9899:2024, 7.3.9.5

```
template<class T> constexpr complex<T> polar(const T& rho, const T& theta = T());
```

Preconditions: `rho` is non-negative and non-NaN. `theta` is finite.

Returns: The `complex` value corresponding to a complex number whose magnitude is `rho` and whose phase angle is `theta`.

29.4.8 Transcendentals [complex.transcendentals]

```
template<class T> constexpr complex<T> acos(const complex<T>& x);
```

Returns: The complex arc cosine of `x`.

Remarks: Behaves the same as the C function `cacos`. See also: ISO/IEC 9899:2024, 7.3.5.1

```
template<class T> constexpr complex<T> asin(const complex<T>& x);
```

Returns: The complex arc sine of `x`.

Remarks: Behaves the same as the C function `casin`. See also: ISO/IEC 9899:2024, 7.3.5.2

```
template<class T> constexpr complex<T> atan(const complex<T>& x);
```

Returns: The complex arc tangent of `x`.

Remarks: Behaves the same as the C function `catan`. See also: ISO/IEC 9899:2024, 7.3.5.3

```
template<class T> constexpr complex<T> acosh(const complex<T>& x);
```

Returns: The complex arc hyperbolic cosine of `x`.

Remarks: Behaves the same as the C function `cacosh`. See also: ISO/IEC 9899:2024, 7.3.6.1

```
template<class T> constexpr complex<T> asinh(const complex<T>& x);
```

9 *Returns*: The complex arc hyperbolic sine of `x`.

10 *Remarks*: Behaves the same as the C function `casinh`. SEE ALSO: ISO/IEC 9899:2024, 7.3.6.2

```
template<class T> constexpr complex<T> atanh(const complex<T>& x);
```

11 *Returns*: The complex arc hyperbolic tangent of `x`.

12 *Remarks*: Behaves the same as the C function `catanh`. SEE ALSO: ISO/IEC 9899:2024, 7.3.6.3

```
template<class T> constexpr complex<T> cos(const complex<T>& x);
```

13 *Returns*: The complex cosine of `x`.

```
template<class T> constexpr complex<T> cosh(const complex<T>& x);
```

14 *Returns*: The complex hyperbolic cosine of `x`.

```
template<class T> constexpr complex<T> exp(const complex<T>& x);
```

15 *Returns*: The complex base-e exponential of `x`.

```
template<class T> constexpr complex<T> log(const complex<T>& x);
```

16 *Returns*: The complex natural (base-e) logarithm of `x`. For all `x`, `imag(log(x))` lies in the interval $[-\pi, \pi]$.

[*Note 1*: The semantics of this function are intended to be the same in C++ as they are for `clog` in C. — *end note*]

17 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> log10(const complex<T>& x);
```

18 *Returns*: The complex common (base-10) logarithm of `x`, defined as `log(x) / log(10)`.

19 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> constexpr complex<T> pow(const complex<T>& x, const T& y);
template<class T> constexpr complex<T> pow(const T& x, const complex<T>& y);
```

20 *Returns*: The complex power of base `x` raised to the $\texttt{y}^{\text{th}}$ power, defined as `exp(y * log(x))`. The value returned for `pow(0, 0)` is implementation-defined.

21 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> sin(const complex<T>& x);
```

22 *Returns*: The complex sine of `x`.

```
template<class T> constexpr complex<T> sinh(const complex<T>& x);
```

23 *Returns*: The complex hyperbolic sine of `x`.

```
template<class T> constexpr complex<T> sqrt(const complex<T>& x);
```

24 *Returns*: The complex square root of `x`, in the range of the right half-plane.

[*Note 2*: The semantics of this function are intended to be the same in C++ as they are for `csqrt` in C. — *end note*]

25 *Remarks*: The branch cuts are along the negative real axis.

```
template<class T> constexpr complex<T> tan(const complex<T>& x);
```

26 *Returns*: The complex tangent of `x`.

```
template<class T> constexpr complex<T> tanh(const complex<T>& x);
```

27 *Returns*: The complex hyperbolic tangent of `x`.

29.4.9 Tuple interface [complex.tuple]

```
template<class T>
struct tuple_size<complex<T>> : integral_constant<size_t, 2> {};
```

```
template<size_t I, class T>
struct tuple_element<I, complex<T>> {
  using type = T;
};
```

1 *Mandates*: `I < 2` is `true`.

```
template<size_t I, class T>
  constexpr T& get(complex<T>& z) noexcept;
template<size_t I, class T>
  constexpr T&& get(complex<T>&& z) noexcept;
template<size_t I, class T>
  constexpr const T& get(const complex<T>& z) noexcept;
template<size_t I, class T>
  constexpr const T&& get(const complex<T>&& z) noexcept;
```

2 *Mandates*: `I < 2` is `true`.

3 *Returns*: A reference to the real part of `z` if `I == 0` is `true`, otherwise a reference to the imaginary part of `z`.

29.4.10 Additional overloads [cmplx.over]

1 The following function templates have additional constexpr overloads:

```
arg                 norm
conj                proj
imag                real
```

2 The additional constexpr overloads are sufficient to ensure:

(2.1) — If the argument has a floating-point type `T`, then it is effectively cast to `complex<T>`.

(2.2) — Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

3 Function template `pow` has additional constexpr overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type `T2` or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T3>>`, where `T3` is `double` if `T2` is an integer type and `T2` otherwise. If `common_type_t<T1, T3>` is not well-formed, then the program is ill-formed.

29.4.11 Suffixes for complex number literals [complex.literals]

1 This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```
constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);
```

2 *Returns*: `complex<long double>{0.0L, static_cast<long double>(d)}`.

```
constexpr complex<double> operator""i(long double d);
constexpr complex<double> operator""i(unsigned long long d);
```

3 *Returns*: `complex<double>{0.0, static_cast<double>(d)}`.

```
constexpr complex<float> operator""if(long double d);
constexpr complex<float> operator""if(unsigned long long d);
```

4 *Returns*: `complex<float>{0.0f, static_cast<float>(d)}`.

29.5 Random number generation [rand]

29.5.1 General [rand.general]

1 Subclause 29.5 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: *uniform random bit generators*, *random number engines*, *random number engine adaptors*, and *random number distributions*. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[*Note 1*: These entities are specified in such a way as to permit the binding of any uniform random bit generator object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — *end note*]

3 Each of the entities specified in 29.5 has an associated arithmetic type (6.9.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

(3.1) — as *boolean* or equivalently as *boolean-valued*, if `T` is `bool`;

(3.2) — otherwise as *integral* or equivalently as *integer-valued*, if `numeric_limits<T>::is_integer` is `true`;

(3.3) — otherwise as *floating-point* or equivalently as *real-valued*.

If integer-valued, an entity may optionally be further characterized as *signed* or *unsigned*, according to `numeric_limits<T>::is_signed`.

4 Unless otherwise specified, all descriptions of calculations in 29.5 use mathematical real numbers.

5 Throughout 29.5, the operators bitand, bitor, and xor denote the respective conventional bitwise operations. Further:

(5.1) — the operator rshift denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

(5.2) — the operator lshift_w denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w.

29.5.2 Header <random> synopsis [rand.synopsis]

```
#include <initializer_list>      // see 17.11.2

namespace std {
  // 29.5.3.3, uniform random bit generator requirements

29.5.3 Requirements [rand.req]

29.5.3.1 General requirements [rand.req.genl]

1 Throughout 29.5, where the template parameters are not constrained, the names of template parameters are used to express type requirements on an instantiated template T:

(1.1) — If `T` has a template type parameter named `Sseq`, `URBG`, `Engine`, `RealType`, `IntType`, or `UIntType`, the program is ill-formed if the corresponding template argument is cv-qualified.

(1.2) — A template argument corresponding to a template parameter named `Sseq` shall meet the requirements of seed sequence (29.5.3.2).

(1.3) — A template argument corresponding to a template parameter named `URBG` shall meet the requirements of uniform random bit generator (29.5.3.3).

(1.4) — A template argument corresponding to a template parameter named `Engine` shall meet the requirements of random number engine (29.5.3.4).

(1.5) — If a template argument corresponding to a template parameter named `RealType` is neither a standard floating-point type (6.9.2) nor a member of an implementation-defined subset of extended floating-point types, the program is ill-formed.

(1.6) — If a template argument corresponding to a template parameter named `IntType` is neither a standard signed nor a standard unsigned integer type (6.9.2), nor an extended integer type whose width is greater or equal to that of `char` and less than or equal to that of `long long`, nor a member of an implementation-defined subset of integer types, the program is ill-formed.

(1.7) — If a template argument corresponding to a template parameter named `UIntType` is neither a standard or extended unsigned integer type whose width is greater or equal to that of `short` and less than or equal to that of `long long`, nor a member of an implementation-defined subset of unsigned integer types, the program is ill-formed.

2 Throughout 29.5, phrases of the form "`x` is an iterator of a specific kind" shall be interpreted as equivalent to the more formal requirement that "`x` is a value of a type meeting the requirements of the specified iterator type".

3 Throughout 29.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

29.5.3.2 Seed sequence requirements [rand.req.seedseq]

1 A *seed sequence* is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values i, $0 \le i < 2^{32}$, based on the consumed data.

[*Note 1*: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — *end note*]

2 A class `S` meets the requirements of a seed sequence if the expressions shown in Table 126 are valid and have the indicated semantics, and if `S` also meets all other requirements of 29.5.3.2. In Table 126 and throughout this subclause:

(2.1) — `T` is the type named by `S`'s associated `result_type`;

(2.2) — `q` is a value of type `S` and `r` is a value of type `S` or `const S`;

(2.3) — `ib` and `ie` are input iterators with an unsigned integer `value_type` of at least 32 bits;

(2.4) — `rb` and `re` are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;

(2.5) — `ob` is an output iterator; and

(2.6) — `il` is a value of type `initializer_list<T>`.

Table 126 — Seed sequence requirements [tab:rand.req.seedseq]

Expression	Return type	Pre/post-condition	Complexity
`S::result_type`	`T`	`T` is an unsigned integer type (6.9.2) of at least 32 bits.	

©ISO/IEC

Table 126 — Seed sequence requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
`S()`		Creates a seed sequence with the same initial state as all other default-constructed seed sequences of type `S`.	constant
`S(ib,ie)`		Creates a seed sequence having internal state that depends on some or all of the bits of the supplied sequence [`ib`, `ie`).	$\mathcal{O}$(`ie` − `ib`)
`S(il)`		Same as `S(il.begin(), il.end())`.	same as `S(il.begin(), il.end())`
`q.generate(rb,re)`	`void`	Does nothing if `rb == re`. Otherwise, fills the supplied sequence [`rb`, `re`) with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also depend on the history of `generate`'s previous invocations.	$\mathcal{O}$(`re` − `rb`)
`r.size()`	`size_t`	The number of 32-bit units that would be copied by a call to `r.param`.	constant
`r.param(ob)`	`void`	Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type `S`, and that would reproduce in that second object a state indistinguishable from the state of the first object.	$\mathcal{O}$(`r.size()`)

29.5.3.3 Uniform random bit generator requirements [rand.req.urng]

1 A *uniform random bit generator* `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[*Note 1*: The degree to which `g`'s results approximate the ideal is often determined statistically. — *end note*]

```
template<class G>
  concept uniform_random_bit_generator =
    invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
    requires {
      { G::min() } -> same_as<invoke_result_t<G&>>;
      { G::max() } -> same_as<invoke_result_t<G&>>;
      requires bool_constant<(G::min() < G::max())>::value;
    };
```

2 Let `g` be an object of type `G`. `G` models `uniform_random_bit_generator` only if

(2.1) — `G::min() <= g()`,

(2.2) — `g() <= G::max()`, and

(2.3) — `g()` has amortized constant complexity.

3 A class `G` meets the *uniform random bit generator* requirements if `G` models `uniform_random_bit_generator`, `invoke_result_t<G&>` is an unsigned integer type (6.9.2), and `G` provides a nested *typedef-name* `result_type` that denotes the same type as `invoke_result_t<G&>`.

29.5.3.4 Random number engine requirements [rand.req.eng]

1 A *random number engine* (commonly shortened to *engine*) `e` of type `E` is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2 At any given time, `e` has a state $\mathtt{e}_i$ for some integer $i \geq 0$. Upon construction, `e` has an initial state $\mathtt{e}_0$. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

3 `E`'s specification shall define:

(3.1) — the size of `E`'s state in multiples of the size of `result_type`, given as an integral constant expression;

(3.2) — the *transition algorithm* TA by which `e`'s state $\mathtt{e}_i$ is advanced to its *successor state* $\mathtt{e}_{i+1}$; and

(3.3) — the *generation algorithm* GA by which an engine's state is mapped to a value of type `result_type`.

4 A class `E` that meets the requirements of a uniform random bit generator (29.5.3.3) also meets the requirements of a *random number engine* if the expressions shown in Table 127 are valid and have the indicated semantics, and if `E` also meets all other requirements of 29.5.3.4. In Table 127 and throughout this subclause:

(4.1) — `T` is the type named by `E`'s associated `result_type`;

(4.2) — `e` is a value of `E`, `v` is an lvalue of `E`, `x` and `y` are (possibly const) values of `E`;

(4.3) — `s` is a value of `T`;

(4.4) — `q` is an lvalue meeting the requirements of a seed sequence (29.5.3.2);

(4.5) — `z` is a value of type `unsigned long long`;

(4.6) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(4.7) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 27 and Clause 31.

Table 127 — Random number engine requirements [tab:rand.req.eng]

Expression	Return type	Pre/post-condition	Complexity
`E()`		Creates an engine with the same initial state as all other default-constructed engines of type `E`.	$\mathcal{O}$(size of state)
`E(x)`		Creates an engine that compares equal to `x`.	$\mathcal{O}$(size of state)
`E(s)`		Creates an engine with initial state determined by `s`.	$\mathcal{O}$(size of state)
`E(q)`[220]		Creates an engine with an initial state that depends on a sequence produced by one call to `q.generate`.	same as complexity of `q.generate` called on a sequence whose length is size of state
`e.seed()`	`void`	*Postconditions*: `e == E()`.	same as `E()`
`e.seed(s)`	`void`	*Postconditions*: `e == E(s)`.	same as `E(s)`
`e.seed(q)`	`void`	*Postconditions*: `e == E(q)`.	same as `E(q)`
`e()`	`T`	Advances `e`'s state $\mathtt{e}_i$ to $\mathtt{e}_{i+1}$ = TA($\mathtt{e}_i$) and returns GA($\mathtt{e}_i$).	per 29.5.3.3
`e.discard(z)`[221]	`void`	Advances `e`'s state $\mathtt{e}_i$ to $\mathtt{e}_{i+\mathtt{z}}$ by any means equivalent to `z` consecutive calls `e()`.	no worse than the complexity of `z` consecutive calls `e()`

220) This constructor (as well as the subsequent corresponding `seed()` function) can be particularly useful to applications requiring a large number of independent random sequences.

221) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes `z` consecutive calls `e()`.

Table 127 — Random number engine requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
`x == y`	`bool`	This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to `x()` and `y()`, respectively, returns `true` if $S_x = S_y$; else returns `false`.	$\mathcal{O}$(size of state)
`x != y`	`bool`	`!(x == y)`.	$\mathcal{O}$(size of state)

5 `E` shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements. These operations shall each be of complexity no worse than $\mathcal{O}$(size of state).

6 On hosted implementations, the following expressions are well-formed and have the specified semantics.

`os << x`

7 *Effects*: With `os.`*`fmtflags`* set to `ios_base::dec|ios_base::left` and the fill character set to the space character, writes to `os` the textual representation of `x`'s current state. In the output, adjacent numbers are separated by one or more space characters.

8 *Postconditions*: The `os.`*`fmtflags`* and fill character are unchanged.

9 *Result*: reference to the type of `os`.

10 *Returns*: `os`.

11 *Complexity*: $\mathcal{O}$(size of state)

`is >> v`

12 *Preconditions*: `is` provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of `is`, and whose type's template specialization arguments `charT` and `traits` were respectively the same as those of `is`.

13 *Effects*: With `is.`*`fmtflags`* set to `ios_base::dec`, sets `v`'s state as determined by reading its textual representation from `is`. If bad input is encountered, ensures that `v`'s state is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If a textual representation written via `os << x` was subsequently read via `is >> v`, then `x == v` provided that there have been no intervening invocations of `x` or of `v`.

14 *Postconditions*: The `is.`*`fmtflags`* are unchanged.

15 *Result*: reference to the type of `is`.

16 *Returns*: `is`.

17 *Complexity*: $\mathcal{O}$(size of state)

29.5.3.5 Random number engine adaptor requirements [rand.req.adapt]

1 A *random number engine adaptor* (commonly shortened to *adaptor*) `a` of type `A` is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine `b` of type `B` adapted in this way is termed a *base engine* in this context. The expression `a.base()` shall be valid and shall return a const reference to `a`'s base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

```
A::A();
```

3 *Effects*: The base engine is initialized as if by its default constructor.

```
bool operator==(const A& a1, const A& a2);
```

4 *Returns*: `true` if `a1`'s base engine is equal to `a2`'s base engine. Otherwise returns `false`.

`A::A(result_type s);`

Effects: The base engine is initialized with `s`.

`template<class Sseq> A::A(Sseq& q);`

Effects: The base engine is initialized with `q`.

`void seed();`

Effects: With `b` as the base engine, invokes `b.seed()`.

`void seed(result_type s);`

Effects: With `b` as the base engine, invokes `b.seed(s)`.

`template<class Sseq> void seed(Sseq& q);`

Effects: With `b` as the base engine, invokes `b.seed(q)`.

`A` shall also meet the following additional requirements:

(10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

(10.2) — The state of `A` shall include the state of its base engine. The size of `A`'s state shall be no less than the size of the base engine.

(10.3) — Copying `A`'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of `A`.

(10.4) — The textual representation of `A` shall include the textual representation of its base engine.

29.5.3.6 Random number distribution requirements [rand.req.dist]

A *random number distribution* (commonly shortened to *distribution*) `d` of type `D` is a function object returning values that are distributed according to an associated mathematical *probability density function* $p(z)$ or according to an associated *discrete probability function* $P(z_i)$. A distribution's specification identifies its associated probability function $p(z)$ or $P(z_i)$.

An associated probability function is typically expressed using certain externally-supplied quantities known as the *parameters of the distribution*. Such distribution parameters are identified in this context by writing, for example, $p(z \mid a, b)$ or $P(z_i \mid a, b)$, to name specific parameters, or by writing, for example, $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$, to denote a distribution's parameters `p` taken as a whole.

A class `D` meets the requirements of a *random number distribution* if the expressions shown in Table 128 are valid and have the indicated semantics, and if `D` and its associated types also meet all other requirements of 29.5.3.6. In Table 128 and throughout this subclause,

(3.1) — `T` is the type named by `D`'s associated `result_type`;

(3.2) — `P` is the type named by `D`'s associated `param_type`;

(3.3) — `d` is a value of `D`, and `x` and `y` are (possibly const) values of `D`;

(3.4) — `glb` and `lub` are values of `T` respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by `d`'s `operator()`, as determined by the current values of `d`'s parameters;

(3.5) — `p` is a (possibly const) value of `P`;

(3.6) — `g`, `g1`, and `g2` are lvalues of a type meeting the requirements of a uniform random bit generator (29.5.3.3);

(3.7) — `os` is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and

(3.8) — `is` is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

where `charT` and `traits` are constrained according to Clause 27 and Clause 31.

Table 128 — Random number distribution requirements [tab:rand.req.dist]

Expression	Return type	Pre/post-condition	Complexity
`D::result_type`	`T`	`T` is an arithmetic type (6.9.2).	
`D::param_type`	`P`		

Table 128 — Random number distribution requirements (continued)

Expression	Return type	Pre/post-condition	Complexity
`D()`		Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type `D`.	constant
`D(p)`		Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct `p`.	same as `p`'s construction
`d.reset()`	`void`	Subsequent uses of `d` do not depend on values produced by any engine prior to invoking `reset`.	constant
`x.param()`	`P`	Returns a value `p` such that `D(p).param() == p`.	no worse than the complexity of `D(p)`
`d.param(p)`	`void`	*Postconditions*: `d.param() == p`.	no worse than the complexity of `D(p)`
`d(g)`	`T`	With `p` = `d.param()`, the sequence of numbers returned by successive invocations with the same object `g` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`d(g,p)`	`T`	The sequence of numbers returned by successive invocations with the same objects `g` and `p` is randomly distributed according to the associated $p(z \mid \{\texttt{p}\})$ or $P(z_i \mid \{\texttt{p}\})$ function.	amortized constant number of invocations of `g`
`x.min()`	`T`	Returns `glb`.	constant
`x.max()`	`T`	Returns `lub`.	constant
`x == y`	`bool`	This operator is an equivalence relation. Returns `true` if `x.param() == y.param()` and $S_1 = S_2$, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to `x(g1)` and `y(g2)` whenever `g1 == g2`. Otherwise returns `false`.	constant
`x != y`	`bool`	`!(x == y)`.	same as `x == y`.

4 `D` shall meet the *Cpp17CopyConstructible* (Table 32) and *Cpp17CopyAssignable* (Table 34) requirements.

5 The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations of `d(g)`.

6 If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.

7 It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In 29.5, declarations of `D::param_type` are in the form of `typedef`s for convenience of exposition only.

8 `P` shall meet the *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17EqualityComparable* (Table 28) requirements.

9 For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, `P` shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, `P` shall have a corresponding member function with the identical name, type, and semantics.

10 `P` shall have a declaration of the form

```
using distribution_type =  D;
```

11 On hosted implementations, the following expressions are well-formed and have the specified semantics.

`os << x`

12 *Effects*: Writes to `os` a textual representation for the parameters and the additional internal data of `x`.

13 *Postconditions*: The `os.`*`fmtflags`* and fill character are unchanged.

14 *Result*: reference to the type of `os`.

15 *Returns*: `os`.

`is >> d`

16 *Preconditions*: `is` provides a textual representation that was previously written using an `os` whose imbued locale and whose type's template specialization arguments `charT` and `traits` were the same as those of `is`.

17 *Effects*: Restores from `is` the parameters and additional internal data of the lvalue `d`. If bad input is encountered, ensures that `d` is unchanged by the operation and calls `is.setstate(ios_base::failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

18 *Postconditions*: The `is.`*`fmtflags`* are unchanged.

19 *Result*: reference to the type of `is`.

20 *Returns*: `is`.

29.5.4 Random number engine class templates [rand.eng]

29.5.4.1 General [rand.eng.general]

1 Each type instantiated from a class template specified in 29.5.4 meets the requirements of a random number engine (29.5.3.4) type.

2 Except where specified otherwise, the complexity of each function specified in 29.5.4 is constant.

3 Except where specified otherwise, no function described in 29.5.4 throws an exception.

4 Every function described in 29.5.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 29.5.4 only for engine operations that are not described in 29.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 29.5.4 requires one or more relationships, involving the value(s) of its constant template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

7 For every random number engine and for every random number engine adaptor `X` defined in 29.5.4 and in 29.5.5:

(7.1) — if the constructor

```
template<class Sseq> explicit X(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

```
template<class Sseq> void seed(Sseq& q);
```

is called with a type `Sseq` that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to `X::result_type`.

29.5.4.2 Class template `linear_congruential_engine` [rand.eng.lcong]

1 A `linear_congruential_engine` random number engine produces unsigned integer random numbers. The state $\mathtt{x}_i$ of a `linear_congruential_engine` object `x` is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $\mathsf{TA}(\mathtt{x}_i) = (a \cdot \mathtt{x}_i + c) \bmod m$; the generation algorithm is $\mathsf{GA}(\mathtt{x}_i) = \mathtt{x}_{i+1}$.

```
namespace std {
  template<class UIntType, UIntType a, UIntType c, UIntType m>
  class linear_congruential_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type multiplier = a;
    static constexpr result_type increment = c;
    static constexpr result_type modulus = m;
    static constexpr result_type min() { return c == 0u ? 1u: 0u; }
    static constexpr result_type max() { return m - 1u; }
    static constexpr result_type default_seed = 1u;

    // constructors and seeding functions
    linear_congruential_engine() : linear_congruential_engine(default_seed) {}
    explicit linear_congruential_engine(result_type s);
    template<class Sseq> explicit linear_congruential_engine(Sseq& q);
    void seed(result_type s = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const linear_congruential_engine& x,
                           const linear_congruential_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,          // hosted
                   const linear_congruential_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,          // hosted
                   linear_congruential_engine& x);
  };
}
```

2 If the template parameter `m` is 0, the modulus m used throughout 29.5.4.2 is `numeric_limits<result_type>::max()` plus 1.

[*Note 1*: m need not be representable as a value of type `result_type`. — *end note*]

3 If the template parameter `m` is not 0, the following relations shall hold: `a < m` and `c < m`.

4 The textual representation consists of the value of x_i.

```
explicit linear_congruential_engine(result_type s);
```

5 *Effects*: If $c \bmod m$ is 0 and `s` mod m is 0, sets the engine's state to 1, otherwise sets the engine's state to `s` mod m.

```
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

6 *Effects*: With $k = \left\lceil \frac{\log_2 m}{32} \right\rceil$ and a an array (or equivalent) of length $k+3$, invokes `q.generate(`$a+0$`,` $a+k+3$`)` and then computes $S = \left(\sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \bmod m$. If $c \bmod m$ is 0 and S is 0, sets the engine's state to 1, else sets the engine's state to S.

29.5.4.3 Class template `mersenne_twister_engine` [rand.eng.mers]

1 A `mersenne_twister_engine` random number engine[222] produces unsigned integer random numbers in the closed interval $[0, 2^w - 1]$. The state x_i of a `mersenne_twister_engine` object `x` is of size n and consists of a sequence X of n values of the type delivered by `x`; all subscripts applied to X are to be taken modulo n.

2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values n and m, a twist value r, and a conditional xor-mask a. To improve the uniformity of the result, the bits of the raw shift register are additionally *tempered* (i.e., scrambled) according to a bit-scrambling matrix defined by values u, d, s, b, t, c, and ℓ.

The state transition is performed as follows:

(2.1) — Concatenate the upper $w-r$ bits of X_{i-n} with the lower r bits of X_{i+1-n} to obtain an unsigned integer value Y.

(2.2) — With $\alpha = a \cdot (Y \mathsf{\ bitand\ } 1)$, set X_i to $X_{i+m-n} \mathsf{\ xor\ } (Y \mathsf{\ rshift\ } 1) \mathsf{\ xor\ } \alpha$.

The sequence X is initialized with the help of an initialization multiplier f.

3 The generation algorithm determines the unsigned integer values z_1, z_2, z_3, z_4 as follows, then delivers z_4 as its result:

(3.1) — Let $z_1 = X_i \mathsf{\ xor\ } \big((X_i \mathsf{\ rshift\ } u) \mathsf{\ bitand\ } d\big)$.

(3.2) — Let $z_2 = z_1 \mathsf{\ xor\ } \big((z_1 \mathsf{\ lshift}_w\ s) \mathsf{\ bitand\ } b\big)$.

(3.3) — Let $z_3 = z_2 \mathsf{\ xor\ } \big((z_2 \mathsf{\ lshift}_w\ t) \mathsf{\ bitand\ } c\big)$.

(3.4) — Let $z_4 = z_3 \mathsf{\ xor\ } (z_3 \mathsf{\ rshift\ } \ell)$.

```
namespace std {
  template<class UIntType, size_t w, size_t n, size_t m, size_t r,
           UIntType a, size_t u, UIntType d, size_t s,
           UIntType b, size_t t,
           UIntType c, size_t l, UIntType f>
  class mersenne_twister_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
    static constexpr size_t shift_size = m;
    static constexpr size_t mask_bits = r;
    static constexpr UIntType xor_mask = a;
    static constexpr size_t tempering_u = u;
    static constexpr UIntType tempering_d = d;
    static constexpr size_t tempering_s = s;
    static constexpr UIntType tempering_b = b;
    static constexpr size_t tempering_t = t;
```

222) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.

```
    static constexpr UIntType tempering_c = c;
    static constexpr size_t tempering_l = l;
    static constexpr UIntType initialization_multiplier = f;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return  2^w - 1; }
    static constexpr result_type default_seed = 5489u;

    // constructors and seeding functions
    mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
    explicit mersenne_twister_engine(result_type value);
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,          // hosted
                   const mersenne_twister_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,          // hosted
                   mersenne_twister_engine& x);
  };
}
```

4 The following relations shall hold: `0 < m`, `m <= n`, `2u < w`, `r <= w`, `u <= w`, `s <= w`, `t <= w`, `l <= w`, `w <= numeric_limits<UIntType>::digits`, `a <= (1u << w) - 1u`, `b <= (1u << w) - 1u`, `c <= (1u << w) - 1u`, `d <= (1u << w) - 1u`, and `f <= (1u << w) - 1u`.

5 The textual representation of $\mathtt{x}_i$ consists of the values of $X_{i-n}, \ldots, X_{i-1}$, in that order.

`explicit mersenne_twister_engine(result_type value);`

6 *Effects*: Sets X_{-n} to `value` mod 2^w. Then, iteratively for $i = 1-n, \ldots, -1$, sets X_i to

$$\left[f \cdot \left(X_{i-1} \mathsf{\ xor\ } \left(X_{i-1} \mathsf{\ rshift\ } (w-2)\right)\right) + i \bmod n\right] \bmod 2^w \ .$$

7 *Complexity*: $\mathcal{O}(n)$.

`template<class Sseq> explicit mersenne_twister_engine(Sseq& q);`

8 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $n \cdot k$, invokes `q.generate(`$a + 0$`,` $a + n \cdot k$`)` and then, iteratively for $i = -n, \ldots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j}\right) \bmod 2^w$. Finally, if the most significant $w - r$ bits of X_{-n} are zero, and if each of the other resulting X_i is 0, changes X_{-n} to 2^{w-1}.

29.5.4.4 Class template `subtract_with_carry_engine` [rand.eng.sub]

1 A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

2 The state $\mathtt{x}_i$ of a `subtract_with_carry_engine` object `x` is of size $\mathcal{O}(r)$, and consists of a sequence X of r integer values $0 \leq X_i < m = 2^w$; all subscripts applied to X are to be taken modulo r. The state $\mathtt{x}_i$ additionally consists of an integer c (known as the *carry*) whose value is either 0 or 1.

3 The state transition is performed as follows:

(3.1) — Let $Y = X_{i-s} - X_{i-r} - c$.

(3.2) — Set X_i to $y = Y \bmod m$. Set c to 1 if $Y < 0$, otherwise set c to 0.

[*Note 1*: This algorithm corresponds to a modular linear function of the form $\mathsf{TA}(\mathtt{x}_i) = (a \cdot \mathtt{x}_i) \bmod b$, where b is of the form $m^r - m^s + 1$ and $a = b - (b-1)/m$. — *end note*]

4 The generation algorithm is given by $\mathsf{GA}(\mathtt{x}_i) = y$, where y is the value produced as a result of advancing the engine's state as described above.

```
namespace std {
  template<class UIntType, size_t w, size_t s, size_t r>
  class subtract_with_carry_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t short_lag = s;
    static constexpr size_t long_lag = r;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr uint_least32_t default_seed = 19780503u;

    // constructors and seeding functions
    subtract_with_carry_engine() : subtract_with_carry_engine(0u) {}
    explicit subtract_with_carry_engine(result_type value);
    template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
    void seed(result_type value = 0u);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const subtract_with_carry_engine& x,
                           const subtract_with_carry_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,            // hosted
                   const subtract_with_carry_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,            // hosted
                   subtract_with_carry_engine& x);
  };
}
```

5 The following relations shall hold: `0u < s`, `s < r`, `0 < w`, and `w <= numeric_limits<UIntType>::digits`.

6 The textual representation consists of the values of $X_{i-r}, \ldots, X_{i-1}$, in that order, followed by c.

`explicit subtract_with_carry_engine(result_type value);`

7 *Effects*: Sets the values of $X_{-r}, \ldots, X_{-1}$, in that order, as specified below. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

To set the values X_k, first construct `e`, a `linear_congruential_engine` object, as if by the following definition:

```
linear_congruential_engine<uint_least32_t, 40014u, 0u, 2147483563u> e(
  value == 0u ? default_seed : static_cast<uint_least32_t>(value % 2147483563u));
```

Then, to set each X_k, obtain new values $z_0, \ldots, z_{n-1}$ from $n = \lceil w/32 \rceil$ successive invocations of `e`. Set X_k to $\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right) \bmod m$.

8 *Complexity*: Exactly $n \cdot \mathtt{r}$ invocations of `e`.

©ISO/IEC

```
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

9 *Effects*: With $k = \lceil w/32 \rceil$ and a an array (or equivalent) of length $r \cdot k$, invokes `q.generate(`$a + 0$`,` $a + r \cdot k$`)` and then, iteratively for $i = -r, \ldots, -1$, sets X_i to $\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \bmod m$. If X_{-1} is then 0, sets c to 1; otherwise sets c to 0.

29.5.4.5 Class template `philox_engine` [rand.eng.philox]

1 A `philox_engine` random number engine produces unsigned integer random numbers in the interval $[0, m)$, where $m = 2^w$ and the template parameter w defines the range of the produced numbers. The state of a `philox_engine` object consists of a sequence X of n unsigned integer values of width w, a sequence K of $n/2$ values of `result_type`, a sequence Y of n values of `result_type`, and a scalar i, where

(1.1) — X is the interpretation of the unsigned integer *counter* value $Z := \sum_{j=0}^{n-1} X_j \cdot 2^{wj}$ of $n \cdot w$ bits,

(1.2) — K are keys, which are generated once from the seed (see constructors below) and remain constant unless the `seed` function (29.5.3.4) is invoked,

(1.3) — Y stores a batch of output values, and

(1.4) — i is an index for an element of the sequence Y.

2 The generation algorithm returns Y_i, the value stored in the i^{th} element of Y after applying the transition algorithm.

3 The state transition is performed as if by the following algorithm:

```
i = i + 1
if (i == n) {
  Y = Philox(K, X) // see below
  Z = Z + 1
  i = 0
}
```

4 The `Philox` function maps the length-$n/2$ sequence K and the length-n sequence X into a length-n output sequence Y. Philox applies an r-round substitution-permutation network to the values in X. A single round of the generation algorithm performs the following steps:

(4.1) — The output sequence X' of the previous round (X in case of the first round) is permuted to obtain the intermediate state V:

$$V_j = X'_{f_n(j)}$$

where $j = 0, \ldots, n-1$ and $f_n(j)$ is defined in Table 129.

Table 129 — Values for the word permutation $f_n(j)$ [tab:rand.eng.philox.f]

$f_n(j)$		j			
		0	1	2	3
n	2	0	1		
	4	2	1	0	3

[*Note 1*: For $n = 2$ the sequence is not permuted. — *end note*]

(4.2) — The following computations are applied to the elements of the V sequence:

$$X_{2k+0} = \text{mulhi}(V_{2k}, M_k, w) \text{ xor } key_k^q \text{ xor } V_{2k+1}$$
$$X_{2k+1} = \text{mullo}(V_{2k}, M_k, w)$$

where:

(4.2.1) — mullo(`a`, `b`, `w`) is the low half of the modular multiplication of `a` and `b`: $(\texttt{a} \cdot \texttt{b}) \mod 2^w$,

(4.2.2) — mulhi(`a`, `b`, `w`) is the high half of the modular multiplication of `a` and `b`: $(\lfloor (\texttt{a} \cdot \texttt{b})/2^w \rfloor)$,

(4.2.3) — $k = 0, \ldots, n/2 - 1$ is the index in the sequences,

(4.2.4) — $q = 0, \ldots, r - 1$ is the index of the round,

(4.2.5) — key_k^q is the k^{th} round key for round q, $key_k^q := (K_k + q \cdot C_k) \mod 2^w$,

(4.2.6) — K_k are the elements of the key sequence K,

©ISO/IEC

(4.2.7) — M_k is `multipliers[`k`]`, and

(4.2.8) — C_k is `round_consts[`k`]`.

5 After r applications of the single-round function, `Philox` returns the sequence $Y = X'$.

```
namespace std {
  template<class UIntType, size_t w, size_t n, size_t r, UIntType... consts>
  class philox_engine {
    static constexpr size_t array-size = n / 2;   // exposition only
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t word_count = n;
    static constexpr size_t round_count = r;
    static constexpr array<result_type, array-size> multipliers;
    static constexpr array<result_type, array-size> round_consts;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return m - 1; }
    static constexpr result_type default_seed = 20111115u;

    // constructors and seeding functions
    philox_engine() : philox_engine(default_seed) {}
    explicit philox_engine(result_type value);
    template<class Sseq> explicit philox_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    void set_counter(const array<result_type, n>& counter);

    // equality operators
    friend bool operator==(const philox_engine& x, const philox_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const philox_engine& x);   // hosted
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, philox_engine& x);         // hosted
  };
}
```

6 *Mandates*:

(6.1) — `sizeof...(consts) == n` is `true`, and

(6.2) — `n == 2 || n == 4` is `true`, and

(6.3) — `0 < r` is `true`, and

(6.4) — `0 < w && w <= numeric_limits<UIntType>::digits` is `true`.

7 The template parameter pack `consts` represents the M_k and C_k constants which are grouped as follows: $[M_0, C_0, M_1, C_1, M_2, C_2, \ldots, M_{n/2-1}, C_{n/2-1}]$.

8 The textual representation consists of the values of $K_0, \ldots, K_{n/2-1}, X_0, \ldots, X_{n-1}, i$, in that order.

[*Note 2*: The stream extraction operator can reconstruct Y from K and X, as needed. — *end note*]

`explicit philox_engine(result_type value);`

9 *Effects*: Sets the K_0 element of sequence K to `value` mod 2^w. All elements of sequences X and K (except K_0) are set to `0`. The value of i is set to $n-1$.

`template<class Sseq> explicit philox_engine(Sseq& q);`

10 *Effects*: With $p = \lceil w/32 \rceil$ and an array (or equivalent) `a` of length $(n/2) \cdot p$, invokes `q.generate(a + 0, a + n / 2 * p)` and then iteratively for $k = 0, \ldots, n/2-1$, sets K_k to $\left(\sum_{j=0}^{p-1} a_{kp+j} \cdot 2^{32j}\right)$ mod 2^w. All elements of sequence X are set to `0`. The value of i is set to $n-1$.

`void set_counter(const array<result_type, n>& c);`

11 *Effects*: For $j = 0, \ldots, n-1$ sets X_j to C_{n-1-j} mod 2^w. The value of i is set to $n-1$.

[*Note 3*: The counter is the value Z introduced at the beginning of this subclause. — *end note*]

29.5.5 Random number engine adaptor class templates [rand.adapt]

29.5.5.1 General [rand.adapt.general]

1 Each type instantiated from a class template specified in 29.5.5 meets the requirements of a random number engine adaptor (29.5.3.5) type.

2 Except where specified otherwise, the complexity of each function specified in 29.5.5 is constant.

3 Except where specified otherwise, no function described in 29.5.5 throws an exception.

4 Every function described in 29.5.5 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 29.5.5 only for adaptor operations that are not described in subclause 29.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 29.5.5 requires one or more relationships, involving the value(s) of its constant template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

29.5.5.2 Class template `discard_block_engine` [rand.adapt.disc]

1 A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine e. The state $\texttt{x}_i$ of a `discard_block_engine` engine adaptor object `x` consists of the state $\texttt{e}_i$ of its base engine `e` and an additional integer n. The size of the state is the size of e's state plus 1.

2 The transition algorithm discards all but $r > 0$ values from each block of $p \geq r$ values delivered by e. The state transition is performed as follows: If $n \geq r$, advance the state of `e` from $\texttt{e}_i$ to $\texttt{e}_{i+p-r}$ and set n to 0. In any case, then increment n and advance `e`'s then-current state $\texttt{e}_j$ to $\texttt{e}_{j+1}$.

3 The generation algorithm yields the value returned by the last invocation of `e()` while advancing `e`'s state as described above.

```
namespace std {
  template<class Engine, size_t p, size_t r>
  class discard_block_engine {
  public:
    // types
    using result_type = Engine::result_type;

    // engine characteristics
    static constexpr size_t block_size = p;
    static constexpr size_t used_block = r;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    discard_block_engine();
    explicit discard_block_engine(const Engine& e);
```

```
    explicit discard_block_engine(Engine&& e);
    explicit discard_block_engine(result_type s);
    template<class Sseq> explicit discard_block_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);     // hosted
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, discard_block_engine& x);           // hosted

  private:
    Engine e;    // exposition only
    size_t n;    // exposition only
  };
}
```

4 The following relations shall hold: `0 < r` and `r <= p`.

5 The textual representation consists of the textual representation of `e` followed by the value of `n`.

6 In addition to its behavior pursuant to subclause 29.5.3.5, each constructor that is not a copy constructor sets `n` to 0.

29.5.5.3 Class template `independent_bits_engine` [rand.adapt.ibits]

1 An `independent_bits_engine` random number engine adaptor combines random numbers that are produced by some base engine e, so as to produce random numbers with a specified number of bits w. The state $\mathtt{x}_i$ of an `independent_bits_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`; the size of the state is the size of e's state.

2 The transition and generation algorithms are described in terms of the following integral constants:

(2.1) — Let $R = \mathtt{e.max()} - \mathtt{e.min()} + 1$ and $m = \lfloor \log_2 R \rfloor$.

(2.2) — With n as determined below, let $w_0 = \lfloor w/n \rfloor$, $n_0 = n - w \bmod n$, $y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor$, and $y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor$.

(2.3) — Let $n = \lceil w/m \rceil$ if and only if the relation $R - y_0 \le \lfloor y_0/n \rfloor$ holds as a result. Otherwise let $n = 1 + \lceil w/m \rceil$.

[*Note 1*: The relation $w = n_0 w_0 + (n - n_0)(w_0 + 1)$ always holds. — *end note*]

3 The transition algorithm is carried out by invoking `e()` as often as needed to obtain n_0 values less than $y_0 + \mathtt{e.min()}$ and $n - n_0$ values less than $y_1 + \mathtt{e.min()}$.

4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity S obtained as if by the following algorithm:

```
S = 0;
for (k = 0; k ≠ n0; k += 1)  {
 do u = e() - e.min(); while (u ≥ y0);
 S = 2^w0 · S + u mod 2^w0;
}
for (k = n0; k ≠ n; k += 1)  {
 do u = e() - e.min(); while (u ≥ y1);
```

```
  S = 2^{w_0+1} · S + u mod 2^{w_0+1};
}

namespace std {
  template<class Engine, size_t w, class UIntType>
  class independent_bits_engine {
  public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w − 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x); // hosted
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);       // hosted

  private:
    Engine e;    // exposition only
  };
}
```

5 The following relations shall hold: `0 < w` and `w <= numeric_limits<result_type>::digits`.

6 The textual representation consists of the textual representation of `e`.

29.5.5.4 Class template `shuffle_order_engine` [rand.adapt.shuf]

1 A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine e, but delivers them in a different sequence. The state $\mathtt{x}_i$ of a `shuffle_order_engine` engine adaptor object `x` consists of the state $\mathtt{e}_i$ of its base engine `e`, an additional value Y of the type delivered by `e`, and an additional sequence V of k values also of the type delivered by `e`. The size of the state is the size of e's state plus $k + 1$.

2 The transition algorithm permutes the values produced by e. The state transition is performed as follows:

(2.1) — Calculate an integer $j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor$.

(2.2) — Set Y to V_j and then set V_j to `e()`.

3 The generation algorithm yields the last value of `Y` produced while advancing `e`'s state as described above.

```
namespace std {
  template<class Engine, size_t k>
  class shuffle_order_engine {
  public:
    // types
    using result_type = Engine::result_type;

    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    // constructors and seeding functions
    shuffle_order_engine();
    explicit shuffle_order_engine(const Engine& e);
    explicit shuffle_order_engine(Engine&& e);
    explicit shuffle_order_engine(result_type s);
    template<class Sseq> explicit shuffle_order_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

  private:
    Engine e;           // exposition only
    result_type V[k];   // exposition only
    result_type Y;      // exposition only
  };
}
```

4 The following relation shall hold: `0 < k`.

5 The textual representation consists of the textual representation of `e`, followed by the `k` values of V, followed by the value of Y.

6 In addition to its behavior pursuant to subclause 29.5.3.5, each constructor that is not a copy constructor initializes `V[0]`, ..., `V[k - 1]` and Y, in that order, with values returned by successive invocations of `e()`.

29.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

```
using minstd_rand0 =
    linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
```

1 *Required behavior*: The 10000^{th} consecutive invocation of a default-constructed object of type `minstd_rand0` produces the value 1043618065.

```
using minstd_rand =
      linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
```

2 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `minstd_rand` produces the value 399268537.

```
using mt19937 =
      mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
       0x9908'b0df, 11, 0xffff'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;
```

3 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `mt19937` produces the value 4123659995.

```
using mt19937_64 =
      mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
       0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
       0x71d6'7fff'eda6'0000, 37, 0xfff7'eee0'0000'0000, 43, 6'364'136'223'846'793'005>;
```

4 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `mt19937_64` produces the value 9981545732273789042.

```
using ranlux24_base =
      subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
```

5 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux24_base` produces the value 7937952.

```
using ranlux48_base =
      subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
```

6 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux48_base` produces the value 61839128582725.

```
using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
```

7 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux24` produces the value 9901578.

```
using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
```

8 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `ranlux48` produces the value 249142670248501.

```
using knuth_b = shuffle_order_engine<minstd_rand0,256>;
```

9 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation of a default-constructed object of type `knuth_b` produces the value 1112339016.

```
using default_random_engine = implementation-defined;
```

10 *Remarks*: The choice of engine type named by this `typedef` is implementation-defined.

[*Note 1*: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this `typedef` need not generate identical sequences across implementations. — *end note*]

```
using philox4x32 =
      philox_engine<uint_fast32_t, 32, 4, 10,
       0xCD9E8D57, 0x9E3779B9, 0xD2511F53, 0xBB67AE85>;
```

11 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation a default-constructed object of type `philox4x32` produces the value 1955073260.

```
using philox4x64 =
      philox_engine<uint_fast64_t, 64, 4, 10,
       0xCA5A826395121157, 0x9E3779B97F4A7C15, 0xD2E7470EE14C6C93, 0xBB67AE8584CAA73B>;
```

12 *Required behavior*: The 10000$^{\text{th}}$ consecutive invocation a default-constructed object of type `philox4x64` produces the value 3409172418970261260.

29.5.7 Class `random_device` [rand.device]

1 A `random_device` uniform random bit generator produces nondeterministic random numbers.

2 If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```
namespace std {
  class random_device {
  public:
    // types
    using result_type = unsigned int;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }

    // constructors
    random_device() : random_device(implementation-defined) {}
    explicit random_device(const string& token);

    // generating functions
    result_type operator()();

    // property functions
    double entropy() const noexcept;

    // no copy functions
    random_device(const random_device&) = delete;
    void operator=(const random_device&) = delete;
  };
}
```

`explicit random_device(const string& token);`

3 *Throws*: A value of an implementation-defined type derived from `exception` if the `random_device` cannot be initialized.

4 *Remarks*: The semantics of the `token` parameter and the token value used by the default constructor are implementation-defined.[223]

`double entropy() const noexcept;`

5 *Returns*: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate[224] for the random numbers returned by `operator()`, in the range `min()` to $\log_2(\texttt{max}() + 1)$.

`result_type operator()();`

6 *Returns*: A nondeterministic random value, uniformly distributed between `min()` and `max()` (inclusive). It is implementation-defined how these values are generated.

7 *Throws*: A value of an implementation-defined type derived from `exception` if a random number cannot be obtained.

29.5.8 Utilities [rand.util]

29.5.8.1 Class `seed_seq` [rand.util.seedseq]

```
namespace std {
  class seed_seq {
  public:
    // types
    using result_type = uint_least32_t;
```

223) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

224) If a device has n states whose respective probabilities are $P_0, \ldots, P_{n-1}$, the device entropy S is defined as $S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i$.

```
    // constructors
    seed_seq() noexcept;
    template<class T>
      seed_seq(initializer_list<T> il);
    template<class InputIterator>
      seed_seq(InputIterator begin, InputIterator end);

    // generating functions
    template<class RandomAccessIterator>
      void generate(RandomAccessIterator begin, RandomAccessIterator end);

    // property functions
    size_t size() const noexcept;
    template<class OutputIterator>
      void param(OutputIterator dest) const;

    // no copy functions
    seed_seq(const seed_seq&) = delete;
    void operator=(const seed_seq&) = delete;

  private:
    vector<result_type> v;      // exposition only
  };
}
```

`seed_seq() noexcept;`

1 *Postconditions*: `v.empty()` is `true`.

```
template<class T>
  seed_seq(initializer_list<T> il);
```

2 *Constraints*: `T` is an integer type.

3 *Effects*: Same as `seed_seq(il.begin(), il.end())`.

```
template<class InputIterator>
  seed_seq(InputIterator begin, InputIterator end);
```

4 *Mandates*: `iterator_traits<InputIterator>::value_type` is an integer type.

5 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

6 *Effects*: Initializes `v` by the following algorithm:

```
for (InputIterator s = begin; s != end; ++s)
  v.push_back((*s) mod 2^32);
```

```
template<class RandomAccessIterator>
  void generate(RandomAccessIterator begin, RandomAccessIterator end);
```

7 *Mandates*: `iterator_traits<RandomAccessIterator>::value_type` is an unsigned integer type capable of accommodating 32-bit quantities.

8 *Preconditions*: `RandomAccessIterator` meets the *Cpp17RandomAccessIterator* requirements (24.3.5.7) and the requirements of a mutable iterator.

9 *Effects*: Does nothing if `begin == end`. Otherwise, with $s =$ `v.size()` and $n =$ `end` $-$ `begin`, fills the supplied range [`begin`, `end`) according to the following algorithm in which each operation is to be carried out modulo 2^{32}, each indexing operator applied to `begin` is to be taken modulo n, and $T(x)$ is defined as x xor (x rshift 27):

(9.1) — By way of initialization, set each element of the range to the value `0x8b8b8b8b`. Additionally, for use in subsequent steps, let $p = (n - t)/2$ and let $q = p + t$, where

$$t = (n \geq 623)\ ?\ 11 : (n \geq 68)\ ?\ 7 : (n \geq 39)\ ?\ 5 : (n \geq 7)\ ?\ 3 : (n - 1)/2;$$

©ISO/IEC 1770

(9.2) — With m as the larger of $s+1$ and n, transform the elements of the range: iteratively for $k = 0, \ldots, m-1$, calculate values

$$r_1 = 1664525 \cdot T(\texttt{begin[}k\texttt{]} \text{ xor } \texttt{begin[}k+p\texttt{]} \text{ xor } \texttt{begin[}k-1\texttt{]})$$
$$r_2 = r_1 + \begin{cases} s & , k = 0 \\ k \bmod n + \texttt{v[}k-1\texttt{]} & , 0 < k \le s \\ k \bmod n & , s < k \end{cases}$$

and, in order, increment `begin[`$k+p$`]` by r_1, increment `begin[`$k+q$`]` by r_2, and set `begin[`k`]` to r_2.

(9.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for $k = m, \ldots, m+n-1$, calculate values

$$r_3 = 1566083941 \cdot T(\texttt{begin[}k\texttt{]} + \texttt{begin[}k+p\texttt{]} + \texttt{begin[}k-1\texttt{]})$$
$$r_4 = r_3 - (k \bmod n)$$

and, in order, update `begin[`$k+p$`]` by xoring it with r_3, update `begin[`$k+q$`]` by xoring it with r_4, and set `begin[`k`]` to r_4.

10 *Throws*: What and when `RandomAccessIterator` operations of `begin` and `end` throw.

```
size_t size() const noexcept;
```

11 *Returns*: The number of 32-bit units that would be returned by a call to `param()`.

12 *Complexity*: Constant time.

```
template<class OutputIterator>
  void param(OutputIterator dest) const;
```

13 *Mandates*: Values of type `result_type` are writable (24.3.1) to `dest`.

14 *Preconditions*: `OutputIterator` meets the *Cpp17OutputIterator* requirements (24.3.5.4).

15 *Effects*: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

16 *Throws*: What and when `OutputIterator` operations of `dest` throw.

29.5.8.2 Function template `generate_canonical` [rand.util.canonical]

```
template<class RealType, size_t digits, class URBG>
  RealType generate_canonical(URBG& g);
```

1 Let

(1.1) — r be `numeric_limits<RealType>::radix`,

(1.2) — R be `g.max()` − `g.min()` + 1,

(1.3) — d be the smaller of `digits` and `numeric_limits<RealType>::digits`,[225]

(1.4) — k be the smallest integer such that $R^k \ge r^d$, and

(1.5) — x be $\lfloor R^k / r^d \rfloor$.

An *attempt* is k invocations of `g()` to obtain values $g_0, \ldots, g_{k-1}$, respectively, and the calculation of a quantity S given by Formula 29.1:

$$S = \sum_{i=0}^{k-1} (g_i - \texttt{g.min()}) \cdot R^i \tag{29.1}$$

2 *Effects*: Attempts are made until $S < x r^d$.

[*Note 1*: When R is a power of r, precisely one attempt is made. — *end note*]

3 *Returns*: $\lfloor S/x \rfloor / r^d$.

225) d is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`.

[*Note 2*: The return value c satisfies $0 \leq c < 1$. — *end note*]

4 *Throws*: What and when `g` throws.

5 *Complexity*: Exactly k invocations of `g` per attempt.

6 [*Note 3*: If the values g_i produced by `g` are uniformly distributed, `generate_canonical`'s results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — *end note*]

7 [*Note 4*: When R is a power of r, an implementation can avoid using an arithmetic type that is wider than the output when computing S. — *end note*]

29.5.9 Random number distribution class templates [rand.dist]

29.5.9.1 General [rand.dist.general]

1 Each type instantiated from a class template specified in 29.5.9 meets the requirements of a random number distribution (29.5.3.6) type.

2 Descriptions are provided in 29.5.9 only for distribution operations that are not described in 29.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

3 The algorithms for producing each of the specified distributions are implementation-defined.

4 The value of each probability density function $p(z)$ and of each discrete probability function $P(z_i)$ specified in this subclause is 0 everywhere outside its stated domain.

29.5.9.2 Uniform distributions [rand.dist.uni]

29.5.9.2.1 Class template `uniform_int_distribution` [rand.dist.uni.int]

1 A `uniform_int_distribution` random number distribution produces random integers i, $a \leq i \leq b$, distributed according to the constant discrete probability function in Formula 29.2.

$$P(i \mid a, b) = 1/(b - a + 1) \tag{29.2}$$

```
namespace std {
  template<class IntType = int>
  class uniform_int_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_int_distribution() : uniform_int_distribution(0) {}
    explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
```

```
    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,          // hosted
                   const uniform_int_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is,          // hosted
                   uniform_int_distribution& x);
  };
}
```

```
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
```

2 *Preconditions*: `a` $\leq$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.2.2 Class template `uniform_real_distribution` [rand.dist.uni.real]

1 A `uniform_real_distribution` random number distribution produces random numbers x, $a \leq x < b$, distributed according to the constant probability density function in Formula 29.3.

$$p(x \mid a, b) = 1/(b - a) \tag{29.3}$$

[*Note 1*: This implies that $p(x \mid a, b)$ is undefined when `a == b`. — *end note*]

```
namespace std {
  template<class RealType = double>
  class uniform_real_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {}
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const uniform_real_distribution& x,
                           const uniform_real_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
```

```
    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
  };
}
```

```
explicit uniform_real_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: `a` $\leq$ `b` and `b` $-$ `a` $\leq$ `numeric_limits<RealType>::max()`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
result_type a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
result_type b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.3 Bernoulli distributions [rand.dist.bern]

29.5.9.3.1 Class `bernoulli_distribution` [rand.dist.bern.bernoulli]

1 A `bernoulli_distribution` random number distribution produces `bool` values b distributed according to the discrete probability function in Formula 29.4.

$$P(b \,|\, p) = \begin{cases} p & \text{if } b = \texttt{true} \\ 1 - p & \text{if } b = \texttt{false} \end{cases} \tag{29.4}$$

```
namespace std {
  class bernoulli_distribution {
  public:
    // types
    using result_type = bool;
    using param_type  = unspecified;

    // constructors and reset functions
    bernoulli_distribution() : bernoulli_distribution(0.5) {}
    explicit bernoulli_distribution(double p);
    explicit bernoulli_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
```

```
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
  };
}
```

```
explicit bernoulli_distribution(double p);
```

2 *Preconditions*: $0 \leq \texttt{p} \leq 1$.

3 *Remarks*: `p` corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the `p` parameter with which the object was constructed.

29.5.9.3.2 Class template `binomial_distribution` [rand.dist.bern.bin]

1 A `binomial_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function in Formula 29.5.

$$P(i \mid t, p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i} \tag{29.5}$$

```
namespace std {
  template<class IntType = int>
  class binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    binomial_distribution() : binomial_distribution(1) {}
    explicit binomial_distribution(IntType t, double p = 0.5);
    explicit binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType t() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);
  };
}
```

©ISO/IEC

```
explicit binomial_distribution(IntType t, double p = 0.5);
```

2 *Preconditions*: $0 \leq$ p ≤ 1 and $0 \leq$ t.

3 *Remarks*: t and p correspond to the respective parameters of the distribution.

```
IntType t() const;
```

4 *Returns*: The value of the t parameter with which the object was constructed.

```
double p() const;
```

5 *Returns*: The value of the p parameter with which the object was constructed.

29.5.9.3.3 Class template geometric_distribution [rand.dist.bern.geo]

1 A geometric_distribution random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function in Formula 29.6.

$$P(i \mid p) = p \cdot (1-p)^i \tag{29.6}$$

```
namespace std {
  template<class IntType = int>
  class geometric_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    geometric_distribution() : geometric_distribution(0.5) {}
    explicit geometric_distribution(double p);
    explicit geometric_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);
  };
}
```

```
explicit geometric_distribution(double p);
```

2 *Preconditions*: $0 <$ p < 1.

3 *Remarks*: p corresponds to the parameter of the distribution.

```
double p() const;
```

4 *Returns*: The value of the p parameter with which the object was constructed.

©ISO/IEC

29.5.9.3.4 Class template `negative_binomial_distribution` [rand.dist.bern.negbin]

1 A `negative_binomial_distribution` random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function in Formula 29.7.

$$P(i \mid k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i \tag{29.7}$$

[*Note 1*: This implies that $P(i \mid k, p)$ is undefined when `p == 1`. — *end note*]

```
namespace std {
  template<class IntType = int>
  class negative_binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {}
    explicit negative_binomial_distribution(IntType k, double p = 0.5);
    explicit negative_binomial_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const negative_binomial_distribution& x,
                           const negative_binomial_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
  };
}
```

`explicit negative_binomial_distribution(IntType k, double p = 0.5);`

2 *Preconditions*: $0 <$ `p` ≤ 1 and $0 <$ `k`.

3 *Remarks*: `k` and `p` correspond to the respective parameters of the distribution.

`IntType k() const;`

4 *Returns*: The value of the `k` parameter with which the object was constructed.

`double p() const;`

5 *Returns*: The value of the `p` parameter with which the object was constructed.

©ISO/IEC

29.5.9.4 Poisson distributions [rand.dist.pois]

29.5.9.4.1 Class template `poisson_distribution` [rand.dist.pois.poisson]

1 A `poisson_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function in Formula 29.8.

$$P(i \mid \mu) = \frac{e^{-\mu}\mu^i}{i\,!} \tag{29.8}$$

The distribution parameter μ is also known as this distribution's *mean*.

```
namespace std {
  template<class IntType = int>
  class poisson_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
  };
}
```

`explicit poisson_distribution(double mean);`

2 *Preconditions*: $0 <$ `mean`.

3 *Remarks*: `mean` corresponds to the parameter of the distribution.

`double mean() const;`

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

29.5.9.4.2 Class template `exponential_distribution` [rand.dist.pois.exp]

1 An `exponential_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.9.

$$p(x \mid \lambda) = \lambda e^{-\lambda x} \tag{29.9}$$

©ISO/IEC

```
namespace std {
  template<class RealType = double>
  class exponential_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    exponential_distribution() : exponential_distribution(1.0) {}
    explicit exponential_distribution(RealType lambda);
    explicit exponential_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType lambda() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
  };
}
```

`explicit exponential_distribution(RealType lambda);`

2 *Preconditions*: $0 <$ `lambda`.

3 *Remarks*: `lambda` corresponds to the parameter of the distribution.

`RealType lambda() const;`

4 *Returns*: The value of the `lambda` parameter with which the object was constructed.

29.5.9.4.3 Class template `gamma_distribution` [rand.dist.pois.gamma]

1 A `gamma_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.10.

$$p(x \mid \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^{\alpha} \cdot \Gamma(\alpha)} \cdot x^{\alpha-1} \tag{29.10}$$

```
namespace std {
  template<class RealType = double>
  class gamma_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;
```

```
    // constructors and reset functions
    gamma_distribution() : gamma_distribution(1.0) {}
    explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
    explicit gamma_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType alpha() const;
    RealType beta() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
  };
}
```

`explicit gamma_distribution(RealType alpha, RealType beta = 1.0);`

2 *Preconditions*: $0 <$ `alpha` and $0 <$ `beta`.

3 *Remarks*: `alpha` and `beta` correspond to the parameters of the distribution.

`RealType alpha() const;`

4 *Returns*: The value of the `alpha` parameter with which the object was constructed.

`RealType beta() const;`

5 *Returns*: The value of the `beta` parameter with which the object was constructed.

29.5.9.4.4 Class template `weibull_distribution` [rand.dist.pois.weibull]

1 A `weibull_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function in Formula 29.11.

$$p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^{a}\right) \tag{29.11}$$

```
namespace std {
  template<class RealType = double>
  class weibull_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    weibull_distribution() : weibull_distribution(1.0) {}
    explicit weibull_distribution(RealType a, RealType b = 1.0);
    explicit weibull_distribution(const param_type& parm);
    void reset();
```

```
    // equality operators
    friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
  };
}
```

```
explicit weibull_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `a` and $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

1 An `extreme_value_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.12.[226]

$$p(x \mid a, b) = \frac{1}{b} \cdot \exp\left(\frac{a-x}{b} - \exp\left(\frac{a-x}{b}\right)\right) \tag{29.12}$$

```
namespace std {
  template<class RealType = double>
  class extreme_value_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    extreme_value_distribution() : extreme_value_distribution(0.0) {}
    explicit extreme_value_distribution(RealType a, RealType b = 1.0);
    explicit extreme_value_distribution(const param_type& parm);
    void reset();
```

226) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

```
    // equality operators
    friend bool operator==(const extreme_value_distribution& x,
                           const extreme_value_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
  };
}
```

```
explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.5 Normal distributions [rand.dist.norm]

29.5.9.5.1 Class template `normal_distribution` [rand.dist.norm.normal]

1 A `normal_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.13.

$$p(x \mid \mu, \sigma) = \frac{1}{\sigma\sqrt{2\pi}} \cdot \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right) \tag{29.13}$$

The distribution parameters μ and σ are also known as this distribution's *mean* and *standard deviation*.

```
namespace std {
  template<class RealType = double>
  class normal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();
```

```
    // equality operators
    friend bool operator==(const normal_distribution& x, const normal_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
  };
}
```

```
explicit normal_distribution(RealType mean, RealType stddev = 1.0);
```

2 *Preconditions*: $0 <$ `stddev`.

3 *Remarks*: `mean` and `stddev` correspond to the respective parameters of the distribution.

```
RealType mean() const;
```

4 *Returns*: The value of the `mean` parameter with which the object was constructed.

```
RealType stddev() const;
```

5 *Returns*: The value of the `stddev` parameter with which the object was constructed.

29.5.9.5.2 Class template `lognormal_distribution` [rand.dist.norm.lognormal]

1 A `lognormal_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.14.

$$p(x \mid m, s) = \frac{1}{sx\sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right) \tag{29.14}$$

```
namespace std {
  template<class RealType = double>
  class lognormal_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    lognormal_distribution() : lognormal_distribution(0.0) {}
    explicit lognormal_distribution(RealType m, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);
```

```
      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

      // property functions
      RealType m() const;
      RealType s() const;
      param_type param() const;
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>
        friend basic_ostream<charT, traits>&
          operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    };
  }
```

`explicit lognormal_distribution(RealType m, RealType s = 1.0);`

2 *Preconditions*: $0 <$ `s`.

3 *Remarks*: `m` and `s` correspond to the respective parameters of the distribution.

`RealType m() const;`

4 *Returns*: The value of the `m` parameter with which the object was constructed.

`RealType s() const;`

5 *Returns*: The value of the `s` parameter with which the object was constructed.

29.5.9.5.3 Class template `chi_squared_distribution` [rand.dist.norm.chisq]

1 A `chi_squared_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function in Formula 29.15.

$$p(x \mid n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}} \tag{29.15}$$

```
  namespace std {
    template<class RealType = double>
    class chi_squared_distribution {
    public:
      // types
      using result_type = RealType;
      using param_type  = unspecified;

      // constructor and reset functions
      chi_squared_distribution() : chi_squared_distribution(1.0) {}
      explicit chi_squared_distribution(RealType n);
      explicit chi_squared_distribution(const param_type& parm);
      void reset();

      // equality operators
      friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

      // generating functions
      template<class URBG>
        result_type operator()(URBG& g);
      template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);
```

```
    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
  };
}
```

```
explicit chi_squared_distribution(RealType n);
```

2 *Preconditions*: $0 <$ `n`.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.5.4 Class template `cauchy_distribution` [rand.dist.norm.cauchy]

1 A `cauchy_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.16.

$$p(x \mid a, b) = \left(\pi b \left(1 + \left(\frac{x-a}{b} \right)^2 \right) \right)^{-1} \tag{29.16}$$

```
namespace std {
  template<class RealType = double>
  class cauchy_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    cauchy_distribution() : cauchy_distribution(0.0) {}
    explicit cauchy_distribution(RealType a, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
```

```
    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
  };
}
```

```
explicit cauchy_distribution(RealType a, RealType b = 1.0);
```

2 *Preconditions*: $0 <$ `b`.

3 *Remarks*: `a` and `b` correspond to the respective parameters of the distribution.

```
RealType a() const;
```

4 *Returns*: The value of the `a` parameter with which the object was constructed.

```
RealType b() const;
```

5 *Returns*: The value of the `b` parameter with which the object was constructed.

29.5.9.5.5 Class template `fisher_f_distribution` [rand.dist.norm.f]

1 A `fisher_f_distribution` random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function in Formula 29.17.

$$p(x \mid m, n) = \frac{\Gamma\big((m+n)/2\big)}{\Gamma(m/2)\,\Gamma(n/2)} \cdot \Big(\frac{m}{n}\Big)^{m/2} \cdot x^{(m/2)-1} \cdot \Big(1 + \frac{mx}{n}\Big)^{-(m+n)/2} \tag{29.17}$$

```
namespace std {
  template<class RealType = double>
  class fisher_f_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    fisher_f_distribution() : fisher_f_distribution(1.0) {}
    explicit fisher_f_distribution(RealType m, RealType n = 1.0);
    explicit fisher_f_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
```

```
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
  };
}
```

```
explicit fisher_f_distribution(RealType m, RealType n = 1);
```

2 *Preconditions*: $0 <$ `m` and $0 <$ `n`.

3 *Remarks*: `m` and `n` correspond to the respective parameters of the distribution.

```
RealType m() const;
```

4 *Returns*: The value of the `m` parameter with which the object was constructed.

```
RealType n() const;
```

5 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.5.6 Class template `student_t_distribution` [rand.dist.norm.t]

1 A `student_t_distribution` random number distribution produces random numbers x distributed according to the probability density function in Formula 29.18.

$$p(x \mid n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma\big((n+1)/2\big)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2} \tag{29.18}$$

```
namespace std {
  template<class RealType = double>
  class student_t_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    student_t_distribution() : student_t_distribution(1.0) {}
    explicit student_t_distribution(RealType n);
    explicit student_t_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
  };
}
```

```
explicit student_t_distribution(RealType n);
```

2 *Preconditions*: 0 < `n`.

3 *Remarks*: `n` corresponds to the parameter of the distribution.

```
RealType n() const;
```

4 *Returns*: The value of the `n` parameter with which the object was constructed.

29.5.9.6 Sampling distributions [rand.dist.samp]

29.5.9.6.1 Class template `discrete_distribution` [rand.dist.samp.discrete]

1 A `discrete_distribution` random number distribution produces random integers i, $0 \le i < n$, distributed according to the discrete probability function in Formula 29.19.

$$P(i \mid p_0, \ldots, p_{n-1}) = p_i \tag{29.19}$$

2 Unless specified otherwise, the distribution parameters are calculated as: $p_k = w_k/S$ for $k = 0, \ldots, n-1$, in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
namespace std {
  template<class IntType = int>
  class discrete_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type  = unspecified;

    // constructor and reset functions
    discrete_distribution();
    template<class InputIterator>
      discrete_distribution(InputIterator firstW, InputIterator lastW);
    discrete_distribution(initializer_list<double> wl);
    template<class UnaryOperation>
      discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
    explicit discrete_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions

    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
  };
}
```

```
discrete_distribution();
```

3 *Effects*: Constructs a `discrete_distribution` object with $n = 1$ and $p_0 = 1$.

[*Note 1*: Such an object will always deliver the value 0. — *end note*]

```
template<class InputIterator>
  discrete_distribution(InputIterator firstW, InputIterator lastW);
```

4 *Mandates*: `is_convertible_v<iterator_traits<InputIterator>::value_type, double>` is `true`.

5 *Preconditions*: `InputIterator` meets the *Cpp17InputIterator* requirements (24.3.5.3). If `firstW == lastW`, let $n = 1$ and $w_0 = 1$. Otherwise, $\big[$`firstW`, `lastW`$\big)$ forms a sequence w of length $n > 0$.

6 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the Formula 29.19.

```
discrete_distribution(initializer_list<double> wl);
```

7 *Effects*: Same as `discrete_distribution(wl.begin(), wl.end())`.

```
template<class UnaryOperation>
  discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
```

8 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

9 *Preconditions*: If `nw` $= 0$, let $n = 1$, otherwise let $n =$ `nw`. The relation $0 < \delta = ($`xmax` $-$ `xmin`$)/n$ holds.

10 *Effects*: Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If `nw` $= 0$, let $w_0 = 1$. Otherwise, let $w_k =$ `fw`$($`xmin` $+ k \cdot \delta + \delta/2)$ for $k = 0, \ldots, n-1$.

11 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<double> probabilities() const;
```

12 *Returns*: A `vector<double>` whose `size` member returns n and whose `operator[]` member returns p_k when invoked with argument k for $k = 0, \ldots, n-1$.

29.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

1 A `piecewise_constant_distribution` random number distribution produces random numbers x, $b_0 \le x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function in Formula 29.20.

$$p(x \mid b_0, \ldots, b_n,\ \rho_0, \ldots, \rho_{n-1}) = \rho_i \text{ , for } b_i \le x < b_{i+1} \tag{29.20}$$

2 The $n + 1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n-1$. Unless specified otherwise, the remaining n distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n-1 \text{ ,}$$

in which the values w_k, commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```
namespace std {
  template<class RealType = double>
  class piecewise_constant_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);
    template<class UnaryOperation>
      piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                      UnaryOperation fw);
```

```
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const piecewise_constant_distribution& x,
                           const piecewise_constant_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
      friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
    template<class charT, class traits>
      friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);
  };
}
```

`piecewise_constant_distribution();`

3 *Effects*: Constructs a `piecewise_constant_distribution` object with $n = 1$, $\rho_0 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
  piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                  InputIteratorW firstW);
```

4 *Mandates*: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (24.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $\big[$`firstB`$,$ `lastB`$\big)$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least n, and any w_k for $k \geq n$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
  piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $w_0 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $\big[$`bl.begin()`$,$ `bl.end()`$\big)$ form a sequence $b_0, \ldots, b_n$, and let $w_k =$ `fw`$\big((b_{k+1} + b_k)/2\big)$ for $k = 0, \ldots, n-1$.

9 *Complexity*: The number of invocations of `fw` does not exceed n.

```
template<class UnaryOperation>
  piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If `nw` $= 0$, let $n = 1$, otherwise let $n =$ `nw`. The relation $0 < \delta =$ (`xmax` $-$ `xmin`)$/n$ holds.

12 *Effects*: Constructs a `piecewise_constant_distribution` object with parameters taken or calculated from the following values: Let $b_k =$ `xmin`$+k\cdot\delta$ for $k = 0, \ldots, n$, and $w_k =$ `fw`$(b_k+\delta/2)$ for $k = 0, \ldots, n-1$.

13 *Complexity*: The number of invocations of `fw` does not exceed n.

```
vector<result_type> intervals() const;
```

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n - 1$.

29.5.9.6.3 Class template `piecewise_linear_distribution` [rand.dist.samp.plinear]

1 A `piecewise_linear_distribution` random number distribution produces random numbers x, $b_0 \le x < b_n$, distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function in Formula 29.21.

$$p(x \mid b_0, \ldots, b_n,\ \rho_0, \ldots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}\ \text{, for } b_i \le x < b_{i+1}. \tag{29.21}$$

2 The $n + 1$ distribution parameters b_i, also known as this distribution's *interval boundaries*, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n - 1$. Unless specified otherwise, the remaining $n + 1$ distribution parameters are calculated as $\rho_k = w_k/S$ for $k = 0, \ldots, n$, in which the values w_k, commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \cdot \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k)\ .$$

```
namespace std {
  template<class RealType = double>
  class piecewise_linear_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type  = unspecified;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
      piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                    InputIteratorW firstW);
    template<class UnaryOperation>
      piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
      piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const piecewise_linear_distribution& x,
                           const piecewise_linear_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
    template<class URBG>
      result_type operator()(URBG& g, const param_type& parm);
```

```
      // property functions
      vector<result_type> intervals() const;
      vector<result_type> densities() const;
      param_type param() const;
      void param(const param_type& parm);
      result_type min() const;
      result_type max() const;

      // inserters and extractors
      template<class charT, class traits>

      template<class charT, class traits>
        friend basic_istream<charT, traits>&
          operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
    };
  }
```

`piecewise_linear_distribution();`

3 *Effects*: Constructs a `piecewise_linear_distribution` object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$.

```
template<class InputIteratorB, class InputIteratorW>
  piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                InputIteratorW firstW);
```

4 *Mandates*: Both of

(4.1) — `is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>`

(4.2) — `is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>`

are `true`.

5 *Preconditions*: `InputIteratorB` and `InputIteratorW` each meet the *Cpp17InputIterator* requirements (24.3.5.3). If `firstB == lastB` or `++firstB == lastB`, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, $\big[$`firstB`, `lastB`$\big)$ forms a sequence b of length $n + 1$, the length of the sequence w starting from `firstW` is at least $n + 1$, and any w_k for $k \geq n + 1$ are ignored by the distribution.

6 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```
template<class UnaryOperation>
  piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

7 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

8 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size()` < 2, let $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. Otherwise, let $\big[$`bl.begin()`,`bl.end()`$\big)$ form a sequence $b_0, \ldots, b_n$, and let $w_k =$ `fw`(b_k) for $k = 0, \ldots, n$.

9 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

```
template<class UnaryOperation>
  piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

10 *Mandates*: `is_invocable_r_v<double, UnaryOperation&, double>` is `true`.

11 *Preconditions*: If `nw` $= 0$, let $n = 1$, otherwise let $n =$ `nw`. The relation $0 < \delta =$ (`xmax` $-$ `xmin`)$/n$ holds.

12 *Effects*: Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let $b_k =$ `xmin` $+ k \cdot \delta$ for $k = 0, \ldots, n$, and $w_k =$ `fw`(b_k) for $k = 0, \ldots, n$.

13 *Complexity*: The number of invocations of `fw` does not exceed $n + 1$.

`vector<result_type> intervals() const;`

14 *Returns*: A `vector<result_type>` whose `size` member returns $n + 1$ and whose `operator[]` member returns b_k when invoked with argument k for $k = 0, \ldots, n$.

```
vector<result_type> densities() const;
```

15 *Returns*: A `vector<result_type>` whose `size` member returns n and whose `operator[]` member returns ρ_k when invoked with argument k for $k = 0, \ldots, n$.

29.5.10 Low-quality random number generation [c.math.rand]

1 [*Note 1*: The header `<cstdlib>` (17.2.2) declares the functions described in this subclause. — *end note*]

```
int rand();
void srand(unsigned int seed);
```

2 *Effects*: The `rand` and `srand` functions have the semantics specified in the C standard library.

3 *Remarks*: The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (16.4.6.10).

[*Note 2*: The other random number generation facilities in this document (29.5) are often preferable to `rand`, because `rand`'s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — *end note*]

  template<class T> valarray<T> log10(const valarray<T>&);

  template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);
  template<class T> valarray<T> pow(const valarray<T>&, const typename valarray<T>::value_type&);
  template<class T> valarray<T> pow(const typename valarray<T>::value_type&, const valarray<T>&);

  template<class T> valarray<T> sin  (const valarray<T>&);
  template<class T> valarray<T> sinh (const valarray<T>&);
  template<class T> valarray<T> sqrt (const valarray<T>&);
  template<class T> valarray<T> tan  (const valarray<T>&);
  template<class T> valarray<T> tanh (const valarray<T>&);
}
```

1 The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

2 The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

3 Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the const member functions of `valarray<T>` other than `begin` and `end` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.[227]

4 Implementations introducing such replacement types shall provide additional functions and operators as follows:

(4.1) — for every function taking a `const valarray<T>&`, identical functions taking the replacement types shall be added;

(4.2) — for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

5 In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

227) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

6 These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

29.6.2 Class template `valarray` [template.valarray]

29.6.2.1 Overview [template.valarray.overview]

```
namespace std {
  template<class T> class valarray {
  public:
    using value_type     = T;
    using iterator       = unspecified;
    using const_iterator = unspecified;

    // 29.6.2.2, construct/destroy
    valarray();
    explicit valarray(size_t);
    valarray(const T&, size_t);
    valarray(const T*, size_t);
    valarray(const valarray&);
    valarray(valarray&&) noexcept;
    valarray(const slice_array<T>&);
    valarray(const gslice_array<T>&);
    valarray(const mask_array<T>&);
    valarray(const indirect_array<T>&);
    valarray(initializer_list<T>);
    ~valarray();

    // 29.6.2.3, assignment
    valarray& operator=(const valarray&);
    valarray& operator=(valarray&&) noexcept;
    valarray& operator=(initializer_list<T>);
    valarray& operator=(const T&);
    valarray& operator=(const slice_array<T>&);
    valarray& operator=(const gslice_array<T>&);
    valarray& operator=(const mask_array<T>&);
    valarray& operator=(const indirect_array<T>&);

    // 29.6.2.4, element access
    const T&          operator[](size_t) const;
    T&                operator[](size_t);

    // 29.6.2.5, subset operations
    valarray          operator[](slice) const;
    slice_array<T>    operator[](slice);
    valarray          operator[](const gslice&) const;
    gslice_array<T>   operator[](const gslice&);
    valarray          operator[](const valarray<bool>&) const;
    mask_array<T>     operator[](const valarray<bool>&);
    valarray          operator[](const valarray<size_t>&) const;
    indirect_array<T> operator[](const valarray<size_t>&);

    // 29.6.2.6, unary operators
    valarray operator+() const;
    valarray operator-() const;
    valarray operator~() const;
    valarray<bool> operator!() const;

    // 29.6.2.7, compound assignment
    valarray& operator*= (const T&);
    valarray& operator/= (const T&);
    valarray& operator%= (const T&);
    valarray& operator+= (const T&);
    valarray& operator-= (const T&);
    valarray& operator^= (const T&);
```

```
    valarray& operator&= (const T&);
    valarray& operator|= (const T&);
    valarray& operator<<=(const T&);
    valarray& operator>>=(const T&);

    valarray& operator*= (const valarray&);
    valarray& operator/= (const valarray&);
    valarray& operator%= (const valarray&);
    valarray& operator+= (const valarray&);
    valarray& operator-= (const valarray&);
    valarray& operator^= (const valarray&);
    valarray& operator|= (const valarray&);
    valarray& operator&= (const valarray&);
    valarray& operator<<=(const valarray&);
    valarray& operator>>=(const valarray&);

    // 29.6.10, range access
    iterator begin();
    iterator end();
    const_iterator begin() const;
    const_iterator end() const;

    // 29.6.2.8, member functions
    void swap(valarray&) noexcept;

    size_t size() const;

    T sum() const;
    T min() const;
    T max() const;

    valarray shift (int) const;
    valarray cshift(int) const;
    valarray apply(T func(T)) const;
    valarray apply(T func(const T&)) const;
    void resize(size_t sz, T c = T());
  };

  template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}
```

1 The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an "array" throughout the remainder of 29.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.[228]

29.6.2.2 Constructors [valarray.cons]

```
valarray();
```

1 *Effects*: Constructs a `valarray` that has zero length.[229]

```
explicit valarray(size_t n);
```

2 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.5).

```
valarray(const T& v, size_t n);
```

3 *Effects*: Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

228) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

229) This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.

```
valarray(const T* p, size_t n);
```

4 *Preconditions*: [p, p + n) is a valid range.

5 *Effects*: Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.[230]

```
valarray(const valarray& v);
```

6 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.[231]

```
valarray(valarray&& v) noexcept;
```

7 *Effects*: Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

8 *Complexity*: Constant.

```
valarray(initializer_list<T> il);
```

9 *Effects*: Equivalent to `valarray(il.data(), il.size())`.

```
valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);
```

10 These conversion constructors convert one of the four reference templates to a `valarray`.

```
~valarray();
```

11 *Effects*: The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

29.6.2.3 Assignment [valarray.assign]

```
valarray& operator=(const valarray& v);
```

1 *Effects*: Each element of the `*this` array is assigned the value of the corresponding element of `v`. If the length of `v` is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

2 *Postconditions*: `size() == v.size()`.

3 *Returns*: `*this`.

```
valarray& operator=(valarray&& v) noexcept;
```

4 *Effects*: `*this` obtains the value of `v`. The value of `v` after the assignment is not specified.

5 *Returns*: `*this`.

6 *Complexity*: Linear.

```
valarray& operator=(initializer_list<T> il);
```

7 *Effects*: Equivalent to: `return *this = valarray(il);`

```
valarray& operator=(const T& v);
```

8 *Effects*: Assigns `v` to each element of `*this`.

9 *Returns*: `*this`.

```
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
```

230) This constructor is the preferred method for converting a C array to a `valarray` object.
231) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.

```
valarray& operator=(const indirect_array<T>&);
```

10 *Preconditions*: The length of the array to which the argument refers equals `size()`. The value of an element in the left-hand side of a `valarray` assignment operator does not depend on the value of another element in that left-hand side.

11 These operators allow the results of a generalized subscripting operation to be assigned directly to a `valarray`.

29.6.2.4 Element access [valarray.access]

```
const T& operator[](size_t n) const;
T& operator[](size_t n);
```

1 *Hardened preconditions*: `n < size()` is `true`.

2 *Returns*: A reference to the corresponding element of the array.

[*Note 1*: The expression `(a[i] = q, a[i]) == q` evaluates to `true` for any non-constant `valarray<T> a`, any `T q`, and for any `size_t i` such that the value of `i` is less than the length of `a`. — *end note*]

3 *Remarks*: The expression `addressof(a[i + j]) == addressof(a[i]) + j` evaluates to `true` for all `size_t i` and `size_t j` such that `i + j < a.size()`.

4 The expression `addressof(a[i]) != addressof(b[j])` evaluates to `true` for any two arrays `a` and `b` and for any `size_t i` and `size_t j` such that `i < a.size()` and `j < b.size()`.

[*Note 2*: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from `operator new`, and other techniques to generate efficient `valarray`s. — *end note*]

5 The reference returned by the subscript operator for an array shall be valid until the member function `resize(size_t, T)` (29.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

29.6.2.5 Subset operations [valarray.sub]

1 The member `operator[]` is overloaded to provide several ways to select sequences of elements from among those controlled by `*this`. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new `valarray` object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of `operator=` and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

```
valarray operator[](slice slicearr) const;
```

2 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `slicearr`.

[*Example 1*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
```

— *end example*]

```
slice_array<T> operator[](slice slicearr);
```

3 *Returns*: An object that holds references to elements of the controlled sequence selected by `slicearr`.

[*Example 2*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
```

— *end example*]

```
valarray operator[](const gslice& gslicearr) const;
```

4 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `gslicearr`.

[*Example 3*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
```

```
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

— *end example*]

```
gslice_array<T> operator[](const gslice& gslicearr);
```

5 *Returns*: An object that holds references to elements of the controlled sequence selected by `gslicearr`.

[*Example 4*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

— *end example*]

```
valarray operator[](const valarray<bool>& boolarr) const;
```

6 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `boolarr`.

[*Example 5*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

— *end example*]

```
mask_array<T> operator[](const valarray<bool>& boolarr);
```

7 *Returns*: An object that holds references to elements of the controlled sequence selected by `boolarr`.

[*Example 6*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
```

— *end example*]

```
valarray operator[](const valarray<size_t>& indarr) const;
```

8 *Returns*: A `valarray` containing those elements of the controlled sequence designated by `indarr`.

[*Example 7*:

```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
```

— *end example*]

```
indirect_array<T> operator[](const valarray<size_t>& indarr);
```

9 *Returns*: An object that holds references to elements of the controlled sequence selected by `indarr`.

[*Example 8*:

```
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
```

— *end example*]

29.6.2.6 Unary operators [valarray.unary]

```
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` (`bool` for `operator!`) or which may be unambiguously implicitly converted to type `T` (`bool` for `operator!`).

2 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

29.6.2.7 Compound assignment [valarray.cassign]

```
valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);
```

1 *Mandates*: The indicated operator can be applied to two operands of type `T`.

2 *Preconditions*: `size() == v.size()` is `true`.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

3 *Effects*: Each of these operators performs the indicated operation on each of the elements of `*this` and the corresponding element of `v`.

4 *Returns*: `*this`.

5 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```
valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
```

6 *Mandates*: The indicated operator can be applied to two operands of type `T`.

7 *Effects*: Each of these operators applies the indicated operation to each element of `*this` and `v`.

8 *Returns*: `*this`.

9 *Remarks*: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

29.6.2.8 Member functions [valarray.members]

```
void swap(valarray& v) noexcept;
```

1 *Effects*: `*this` obtains the value of `v`. `v` obtains the value of `*this`.

2 *Complexity*: Constant.

```
size_t size() const;
```

3 *Returns*: The number of elements in the array.

4 *Complexity*: Constant time.

```
T sum() const;
```

5 *Mandates*: `operator+=` can be applied to operands of type `T`.

6 *Preconditions*: `size() > 0` is `true`.

7 *Returns*: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying `operator+=` to a copy of an element of the array and all other elements of the array in an unspecified order.

```
T min() const;
```

8 *Preconditions*: `size() > 0` is `true`.

9 *Returns*: The minimum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
T max() const;
```

10 *Preconditions*: `size() > 0` is `true`.

11 *Returns*: The maximum value contained in `*this`. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using `operator<`.

```
valarray shift(int n) const;
```

12 *Returns*: A `valarray` of length `size()`, each of whose elements I is `(*this)[`I `+ n]` if I `+ n` is non-negative and less than `size()`, otherwise `T()`.

[*Note 1*: If element zero is taken as the leftmost element, a positive value of `n` shifts the elements left `n` places, with zero fill. — *end note*]

13 [*Example 1*: If the argument has the value −2, the first two elements of the result will be value-initialized (9.5); the third element of the result will be assigned the value of the first element of `*this`; etc. — *end example*]

```
valarray cshift(int n) const;
```

14 *Returns*: A `valarray` of length `size()` that is a circular shift of `*this`. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right $-n$ places.

```
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
```

15 *Returns*: A `valarray` whose length is `size()`. Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of `*this`.

```
void resize(size_t sz, T c = T());
```

16 *Effects*: Changes the length of the `*this` array to `sz` and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

29.6.3 `valarray` non-member operations [valarray.nonmembers]

29.6.3.1 Binary operators [valarray.binary]

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
```

```
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

2 *Preconditions*: The argument arrays have the same length.

3 *Returns*: A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<T> operator* (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator* (const typename valarray<T>::value_type&,

template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&,
                                         const typename valarray<T>::value_type&);
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&,
                                         const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

5 *Returns*: A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

29.6.3.2 Logical operators [valarray.comparison]

```
template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
```

```
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);
```

1 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

2 *Preconditions*: The two array arguments have the same length.

3 *Returns*: A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

```
template<class T> valarray<bool> operator==(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator< (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator< (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator> (const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator> (const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&,
                                            const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&,
                                            const valarray<T>&);
```

4 *Mandates*: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

5 *Returns*: A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

29.6.3.3 Transcendentals [valarray.transcend]

```
template<class T> valarray<T> abs  (const valarray<T>&);
template<class T> valarray<T> acos (const valarray<T>&);
template<class T> valarray<T> asin (const valarray<T>&);
template<class T> valarray<T> atan (const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> cos  (const valarray<T>&);
template<class T> valarray<T> cosh (const valarray<T>&);
template<class T> valarray<T> exp  (const valarray<T>&);
template<class T> valarray<T> log  (const valarray<T>&);
```

```
template<class T> valarray<T> log10(const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> pow  (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> pow  (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> sin  (const valarray<T>&);
template<class T> valarray<T> sinh (const valarray<T>&);
template<class T> valarray<T> sqrt (const valarray<T>&);
template<class T> valarray<T> tan  (const valarray<T>&);
template<class T> valarray<T> tanh (const valarray<T>&);
```

1 *Mandates*: A unique function with the indicated name can be applied (unqualified) to an operand of type `T`. This function returns a value of type `T` or which can be unambiguously implicitly converted to type `T`.

29.6.3.4 Specialized algorithms [valarray.special]

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;
```

1 *Effects*: Equivalent to `x.swap(y)`.

29.6.4 Class `slice` [class.slice]

29.6.4.1 Overview [class.slice.overview]

```
namespace std {
  class slice {
  public:
    slice();
    slice(size_t, size_t, size_t);
    slice(const slice&);

    size_t start() const;
    size_t size() const;
    size_t stride() const;

    friend bool operator==(const slice& x, const slice& y);
  };
}
```

1 The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.[232]

29.6.4.2 Constructors [cons.slice]

```
slice();
slice(size_t start, size_t length, size_t stride);
```

1 The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

2 [*Example 1*: `slice(3, 8, 2)` constructs a slice which selects elements $3, 5, 7, \ldots, 17$ from an array. — *end example*]

29.6.4.3 Access functions [slice.access]

```
size_t start() const;
size_t size() const;
size_t stride() const;
```

1 *Returns*: The start, length, or stride specified by a `slice` object.

2 *Complexity*: Constant time.

232) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.

29.6.4.4 Operators [slice.ops]

```
friend bool operator==(const slice& x, const slice& y);
```

1 *Effects*: Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

29.6.5 Class template slice_array [template.slice.array]

29.6.5.1 Overview [template.slice.array.overview]

```
namespace std {
  template<class T> class slice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    slice_array(const slice_array&);
    ~slice_array();
    const slice_array& operator=(const slice_array&) const;
    void operator=(const T&) const;

    slice_array() = delete;
  };
}
```

1 This template is a helper template used by the `slice` subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```

2 It has reference semantics to a subset of an array specified by a `slice` object.

[*Example 1*: The expression `a[slice(1, 5, 3)] = b;` has the effect of assigning the elements of `b` to a slice of the elements in `a`. For the slice shown, the elements selected from `a` are $1, 4, \ldots, 13$. — *end example*]

29.6.5.2 Assignment [slice.arr.assign]

```
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.5.3 Compound assignment [slice.arr.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.5.4 Fill function [slice.arr.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

29.6.6 The `gslice` class [class.gslice]

29.6.6.1 Overview [class.gslice.overview]

```
namespace std {
  class gslice {
  public:
    gslice();
    gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

    size_t           start() const;
    valarray<size_t> size() const;
    valarray<size_t> stride() const;
  };
}
```

1 This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset (s), a set of lengths (l_j), and a set of strides (d_j). The number of lengths shall equal the number of strides.

2 A `gslice` represents a mapping from a set of indices (i_j), equal in number to the number of strides, to a single index k. It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices i_j range in value from 0 to $l_{ij} - 1$.

3 [*Example 1*: The `gslice` specification

```
start  = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

$$k = 3 + (0,1) \times 19 + (0,1,2,3) \times 4 + (0,1,2) \times 1$$

which are ordered as shown in the following table:

$$\begin{array}{rrrrr} (i_0, & i_1, & i_2, & k) & = \\ & (0, & 0, & 0, & 3), \\ & (0, & 0, & 1, & 4), \\ & (0, & 0, & 2, & 5), \\ & (0, & 1, & 0, & 7), \\ & (0, & 1, & 1, & 8), \\ & (0, & 1, & 2, & 9), \\ & (0, & 2, & 0, & 11), \\ & (0, & 2, & 1, & 12), \\ & (0, & 2, & 2, & 13), \\ & (0, & 3, & 0, & 15), \\ & (0, & 3, & 1, & 16), \\ & (0, & 3, & 2, & 17), \\ & (1, & 0, & 0, & 22), \\ & (1, & 0, & 1, & 23), \\ & \ldots & & & \\ & (1, & 3, & 2, & 36) \end{array}$$

That is, the highest-ordered index turns fastest. — *end example*]

4 It is possible to have degenerate generalized slices in which an address is repeated.

©ISO/IEC

5 [*Example 2*: If the stride parameters in the previous example are changed to {1, 1, 1}, the first few elements of the resulting sequence of indices will be

(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 0, 2, 5),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
...

— *end example*]

6 If a degenerate slice is used as the argument to the non-`const` version of `operator[](const gslice&)`, the behavior is undefined.

29.6.6.2 Constructors [gslice.cons]

```
gslice();
gslice(size_t start, const valarray<size_t>& lengths,
       const valarray<size_t>& strides);
```

1 The default constructor is equivalent to `gslice(0, valarray<size_t>(), valarray<size_t>())`. The constructor with arguments builds a `gslice` based on a specification of start, lengths, and strides, as explained in the previous subclause.

29.6.6.3 Access functions [gslice.access]

```
size_t          start()  const;
valarray<size_t> size() const;
valarray<size_t> stride() const;
```

1 *Returns*: The representation of the start, lengths, or strides specified for the `gslice`.

2 *Complexity*: `start()` is constant time. `size()` and `stride()` are linear in the number of strides.

29.6.7 Class template `gslice_array` [template.gslice.array]

29.6.7.1 Overview [template.gslice.array.overview]

```
namespace std {
  template<class T> class gslice_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    gslice_array(const gslice_array&);
    ~gslice_array();
    const gslice_array& operator=(const gslice_array&) const;
    void operator=(const T&) const;

    gslice_array() = delete;
  };
}
```

1 This template is a helper template used by the `gslice` subscript operator

```
gslice_array<T> valarray<T>::operator[](const gslice&);
```

2 It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

29.6.7.2 Assignment [gslice.array.assign]

```
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

29.6.7.3 Compound assignment [gslice.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

29.6.7.4 Fill function [gslice.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.

29.6.8 Class template `mask_array` [template.mask.array]

29.6.8.1 Overview [template.mask.array.overview]

```
namespace std {
  template<class T> class mask_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    mask_array(const mask_array&);
    ~mask_array();
    const mask_array& operator=(const mask_array&) const;
    void operator=(const T&) const;
```

```
    mask_array() = delete;
  };
}
```

1 This template is a helper template used by the mask subscript operator:

```
mask_array<T> valarray<T>::operator[](const valarray<bool>&);
```

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

29.6.8.2 Assignment [mask.array.assign]

```
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.8.3 Compound assignment [mask.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.8.4 Fill function [mask.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

29.6.9 Class template `indirect_array` [template.indirect.array]

29.6.9.1 Overview [template.indirect.array.overview]

```
namespace std {
  template<class T> class indirect_array {
  public:
    using value_type = T;

    void operator=  (const valarray<T>&) const;
    void operator*= (const valarray<T>&) const;
    void operator/= (const valarray<T>&) const;
    void operator%= (const valarray<T>&) const;
    void operator+= (const valarray<T>&) const;
    void operator-= (const valarray<T>&) const;
    void operator^= (const valarray<T>&) const;
    void operator&= (const valarray<T>&) const;
    void operator|= (const valarray<T>&) const;
    void operator<<=(const valarray<T>&) const;
    void operator>>=(const valarray<T>&) const;

    indirect_array(const indirect_array&);
    ~indirect_array();
    const indirect_array& operator=(const indirect_array&) const;
    void operator=(const T&) const;
```

```
    indirect_array() = delete;
  };
}
```

1 This template is a helper template used by the indirect subscript operator

```
indirect_array<T> valarray<T>::operator[](const valarray<size_t>&);
```

2 It has reference semantics to a subset of an array specified by an `indirect_array`. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in `indirect`.

29.6.9.2 Assignment [indirect.array.assign]

```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

3 [*Example 1*:

```
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
```

results in undefined behavior since element 4 is specified twice in the indirection. — *end example*]

29.6.9.3 Compound assignment [indirect.array.comp.assign]

```
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `indirect_array` object refers.

2 If the `indirect_array` specifies an element in the `valarray<T>` object to which it refers more than once, the behavior is undefined.

29.6.9.4 Fill function [indirect.array.fill]

```
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `indirect_array` object refers.

29.6.10 Range access [valarray.range]

1 The `iterator` type is a type that meets the requirements of a mutable *Cpp17RandomAccessIterator* (24.3.5.7) and models `contiguous_iterator` (24.3.4.14). Its `value_type` is the template parameter `T` and its `reference` type is `T&`. The `const_iterator` type meets the requirements of a constant *Cpp17RandomAccessIterator* and models `contiguous_iterator`. Its `value_type` is the template parameter `T` and its `reference` type is `const T&`.

2 The iterators returned by `begin` and `end` for an array are guaranteed to be valid until the member function `resize(size_t, T)` (29.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

```
iterator begin();
const_iterator begin() const;
```

3 *Returns*: An iterator referencing the first value in the array.

```
iterator end();
const_iterator end() const;
```

4 *Returns*: An iterator referencing one past the last value in the array.

29.7 Mathematical functions for floating-point types [c.math]

  // 29.7.6.22, spherical Neumann functions;
  // spherical Bessel functions of the second kind
  floating-point-type sph_neumann(unsigned n, floating-point-type x);
  float               sph_neumannf(unsigned n, float x);
  long double         sph_neumannl(unsigned n, long double x);
}
```

1 The contents and meaning of the header `<cmath>` are a subset of the C standard library header `<math.h>` and only the declarations shown in the synopsis above are present, with the addition of a three-dimensional hypotenuse function (29.7.3), a linear interpolation function (29.7.4), and the mathematical special functions described in 29.7.6.

[*Note 1*: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — *end note*]

2 For each function with at least one parameter of type *`floating-point-type`*, the implementation provides an overload for each cv-unqualified floating-point type (6.9.2) where all uses of *`floating-point-type`* in the function signature are replaced with that floating-point type.

3 For each function with at least one parameter of type *`floating-point-type`* other than `abs`, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a *`floating-point-type`* parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of all such arguments, where arguments of integer type are considered to have the same floating-point conversion rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

4 An invocation of `nexttoward` is ill-formed if the argument corresponding to the *`floating-point-type`* parameter has extended floating-point type.

See also: ISO/IEC 9899:2024, 7.12

29.7.2 Absolute values [c.math.abs]

1 [*Note 1*: The headers `<cstdlib>` (17.2.2) and `<cmath>` (29.7.1) declare the functions described in this subclause. — *end note*]

```
constexpr int abs(int j);
constexpr long int abs(long int j);
```

```
constexpr long long int abs(long long int j);
```

2 *Effects*: These functions have the semantics specified in the C standard library for the functions `abs`, `labs`, and `llabs`, respectively.

3 *Remarks*: If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[*Note 2*: Allowing arguments that can be promoted to `int` provides compatibility with C. — *end note*]

```
constexpr floating-point-type abs(floating-point-type x);
```

4 *Returns*: The absolute value of `x`.

See also: ISO/IEC 9899:2024, 7.12.8.3, 7.24.7.1

29.7.3 Three-dimensional hypotenuse [c.math.hypot3]

```
constexpr floating-point-type hypot(floating-point-type x, floating-point-type y,
                                    floating-point-type z);
```

1 *Returns*: $\sqrt{x^2 + y^2 + z^2}$.

29.7.4 Linear interpolation [c.math.lerp]

```
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b,
                                   floating-point-type t) noexcept;
```

1 *Returns*: $a + t(b - a)$.

2 *Remarks*: Let `r` be the value returned. If `isfinite(a) && isfinite(b)`, then:

(2.1) — If `t == 0`, then `r == a`.

(2.2) — If `t == 1`, then `r == b`.

(2.3) — If `t >= 0 && t <= 1`, then `isfinite(r)`.

(2.4) — If `isfinite(t) && a == b`, then `r == a`.

(2.5) — If `isfinite(t) || !isnan(t) && b - a != 0`, then `!isnan(r)`.

Let *CMP*`(x,y)` be `1` if `x > y`, `-1` if `x < y`, and `0` otherwise. For any `t1` and `t2`, the product of *CMP*`(lerp(a, b, t2), lerp(a, b, t1))`, *CMP*`(t2, t1)`, and *CMP*`(b, a)` is non-negative.

29.7.5 Classification / comparison functions [c.math.fpclass]

1 The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library.

See also: ISO/IEC 9899:2024, 7.12.4, 7.12.18

29.7.6 Mathematical special functions [sf.cmath]

29.7.6.1 General [sf.cmath.general]

1 If any argument value to any of the functions specified in 29.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

(1.1) — the function description's *Returns*: element explicitly specifies a domain and those argument values fall outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or

(1.3) — the corresponding mathematical function is not mathematically defined.[233]

2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

233) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.

29.7.6.2 Associated Laguerre polynomials [sf.cmath.assoc.laguerre]

```
floating-point-type assoc_laguerre(unsigned n, unsigned m, floating-point-type x);
float       assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Laguerre polynomials of their respective arguments `n`, `m`, and `x`.

2 *Returns*: $\mathsf{L}_n^m(x)$, where L_n^m is given by Formula 29.22, L_{n+m} is given by Formula 29.37, n is `n`, m is `m`, and x is `x`.

$$\mathsf{L}_n^m(x) = (-1)^m \frac{\mathsf{d}^m}{\mathsf{d}x^m} \mathsf{L}_{n+m}(x) \ , \quad \text{for } x \geq 0 \tag{29.22}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128` or if `m >= 128`.

29.7.6.3 Associated Legendre functions [sf.cmath.assoc.legendre]

```
floating-point-type assoc_legendre(unsigned l, unsigned m, floating-point-type x);
float       assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);
```

1 *Effects*: These functions compute the associated Legendre functions of their respective arguments `l`, `m`, and `x`.

2 *Returns*: $\mathsf{P}_\ell^m(x)$, where P_ℓ^m is given by Formula 29.23, P_ℓ is given by Formula 29.38, ℓ is `l`, m is `m`, and x is `x`.

$$\mathsf{P}_\ell^m(x) = (1 - x^2)^{m/2} \frac{\mathsf{d}^m}{\mathsf{d}x^m} \mathsf{P}_\ell(x) \ , \quad \text{for } |x| \leq 1 \tag{29.23}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

29.7.6.4 Beta function [sf.cmath.beta]

```
floating-point-type beta(floating-point-type x, floating-point-type y);
float       betaf(float x, float y);
long double betal(long double x, long double y);
```

1 *Effects*: These functions compute the beta function of their respective arguments `x` and `y`.

2 *Returns*: $\mathsf{B}(x, y)$, where B is given by Formula 29.24, x is `x` and y is `y`.

$$\mathsf{B}(x, y) = \frac{\Gamma(x)\,\Gamma(y)}{\Gamma(x + y)} \ , \quad \text{for } x > 0, \ y > 0 \tag{29.24}$$

29.7.6.5 Complete elliptic integral of the first kind [sf.cmath.comp.ellint.1]

```
floating-point-type comp_ellint_1(floating-point-type k);
float       comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the first kind of their respective arguments `k`.

2 *Returns*: $\mathsf{K}(k)$, where K is given by Formula 29.25 and k is `k`.

$$\mathsf{K}(k) = \mathsf{F}(k, \pi/2) \ , \quad \text{for } |k| \leq 1 \tag{29.25}$$

3 See also 29.7.6.12.

29.7.6.6 Complete elliptic integral of the second kind [sf.cmath.comp.ellint.2]

```
floating-point-type comp_ellint_2(floating-point-type k);
float       comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

1 *Effects*: These functions compute the complete elliptic integral of the second kind of their respective arguments `k`.

2 *Returns*: $\mathsf{E}(k)$, where E is given by Formula 29.26 and k is `k`.

$$\mathsf{E}(k) = \mathsf{E}(k, \pi/2) \ , \quad \text{for } |k| \le 1 \tag{29.26}$$

3 See also 29.7.6.13.

29.7.6.7 Complete elliptic integral of the third kind [sf.cmath.comp.ellint.3]

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float       comp_ellint_3f(float k, float nu);
long double  comp_ellint_3l(long double k, long double nu);
```

1 *Effects*: These functions compute the complete elliptic integral of the third kind of their respective arguments `k` and `nu`.

2 *Returns*: $\Pi(\nu, k)$, where Π is given by Formula 29.27, k is `k`, and ν is `nu`.

$$\Pi(\nu, k) = \Pi(\nu, k, \pi/2) \ , \quad \text{for } |k| \le 1 \tag{29.27}$$

3 See also 29.7.6.14.

29.7.6.8 Regular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.i]

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float       cyl_bessel_if(float nu, float x);
long double  cyl_bessel_il(long double nu, long double x);
```

1 *Effects*: These functions compute the regular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{I}_\nu(x)$, where I_ν is given by Formula 29.28, ν is `nu`, and x is `x`.

$$\mathsf{I}_\nu(x) = \mathrm{i}^{-\nu}\mathsf{J}_\nu(\mathrm{i}x) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)} \ , \quad \text{for } x \ge 0 \tag{29.28}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.9.

29.7.6.9 Cylindrical Bessel functions of the first kind [sf.cmath.cyl.bessel.j]

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float       cyl_bessel_jf(float nu, float x);
long double  cyl_bessel_jl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{J}_\nu(x)$, where J_ν is given by Formula 29.29, ν is `nu`, and x is `x`.

$$\mathsf{J}_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k(x/2)^{\nu+2k}}{k!\,\Gamma(\nu+k+1)} \ , \quad \text{for } x \ge 0 \tag{29.29}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

29.7.6.10 Irregular modified cylindrical Bessel functions [sf.cmath.cyl.bessel.k]

```
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float       cyl_bessel_kf(float nu, float x);
long double  cyl_bessel_kl(long double nu, long double x);
```

1 *Effects*: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{K}_\nu(x)$, where K_ν is given by Formula 29.30, ν is `nu`, and x is `x`.

$$\mathsf{K}_\nu(x) = (\pi/2)\mathrm{i}^{\nu+1}(\mathsf{J}_\nu(\mathrm{i}x) + \mathrm{i}\mathsf{N}_\nu(\mathrm{i}x)) = \begin{cases} \dfrac{\pi}{2}\dfrac{\mathsf{I}_{-\nu}(x) - \mathsf{I}_\nu(x)}{\sin\nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \dfrac{\pi}{2}\lim\limits_{\mu\to\nu}\dfrac{\mathsf{I}_{-\mu}(x) - \mathsf{I}_\mu(x)}{\sin\mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \tag{29.30}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.8, 29.7.6.9, 29.7.6.11.

29.7.6.11 Cylindrical Neumann functions [sf.cmath.cyl.neumann]

```
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float       cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 *Effects*: These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

2 *Returns*: $\mathsf{N}_\nu(x)$, where N_ν is given by Formula 29.31, ν is `nu`, and x is `x`.

$$\mathsf{N}_\nu(x) = \begin{cases} \dfrac{\mathsf{J}_\nu(x)\cos\nu\pi - \mathsf{J}_{-\nu}(x)}{\sin\nu\pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\ \lim\limits_{\mu\to\nu}\dfrac{\mathsf{J}_\mu(x)\cos\mu\pi - \mathsf{J}_{-\mu}(x)}{\sin\mu\pi}, & \text{for } x \geq 0 \text{ and integral } \nu \end{cases} \tag{29.31}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `nu >= 128`.

4 See also 29.7.6.9.

29.7.6.12 Incomplete elliptic integral of the first kind [sf.cmath.ellint.1]

```
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float       ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the first kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*: $\mathsf{F}(k, \phi)$, where F is given by Formula 29.32, k is `k`, and ϕ is `phi`.

$$\mathsf{F}(k, \phi) = \int_0^\phi \frac{\mathrm{d}\theta}{\sqrt{1 - k^2\sin^2\theta}}\,, \quad \text{for } |k| \leq 1 \tag{29.32}$$

29.7.6.13 Incomplete elliptic integral of the second kind [sf.cmath.ellint.2]

```
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float       ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the second kind of their respective arguments `k` and `phi` (`phi` measured in radians).

2 *Returns*: $\mathsf{E}(k, \phi)$, where E is given by Formula 29.33, k is `k`, and ϕ is `phi`.

$$\mathsf{E}(k, \phi) = \int_0^\phi \sqrt{1 - k^2\sin^2\theta}\,\mathrm{d}\theta\,, \quad \text{for } |k| \leq 1 \tag{29.33}$$

29.7.6.14 Incomplete elliptic integral of the third kind [sf.cmath.ellint.3]

```
floating-point-type ellint_3(floating-point-type k, floating-point-type nu,
                             floating-point-type phi);
float       ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

1 *Effects*: These functions compute the incomplete elliptic integral of the third kind of their respective arguments `k`, `nu`, and `phi` (`phi` measured in radians).

2 *Returns*: $\Pi(\nu, k, \phi)$, where Π is given by Formula 29.34, ν is `nu`, k is `k`, and ϕ is `phi`.

$$\Pi(\nu, k, \phi) = \int_0^{\phi} \frac{\mathrm{d}\theta}{(1 - \nu \sin^2\theta)\sqrt{1 - k^2 \sin^2\theta}} \ , \quad \text{for } |k| \le 1 \tag{29.34}$$

29.7.6.15 Exponential integral [sf.cmath.expint]

```
floating-point-type expint(floating-point-type x);
float       expintf(float x);
long double expintl(long double x);
```

1 *Effects*: These functions compute the exponential integral of their respective arguments `x`.

2 *Returns*: $\mathsf{Ei}(x)$, where Ei is given by Formula 29.35 and x is `x`.

$$\mathsf{Ei}(x) = -\int_{-x}^{\infty} \frac{e^{-t}}{t}\,\mathrm{d}t \tag{29.35}$$

29.7.6.16 Hermite polynomials [sf.cmath.hermite]

```
floating-point-type hermite(unsigned n, floating-point-type x);
float       hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Hermite polynomials of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{H}_n(x)$, where H_n is given by Formula 29.36, n is `n`, and x is `x`.

$$\mathsf{H}_n(x) = (-1)^n e^{x^2} \frac{\mathrm{d}^n}{\mathrm{d}x^n} e^{-x^2} \tag{29.36}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

29.7.6.17 Laguerre polynomials [sf.cmath.laguerre]

```
floating-point-type laguerre(unsigned n, floating-point-type x);
float       laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);
```

1 *Effects*: These functions compute the Laguerre polynomials of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{L}_n(x)$, where L_n is given by Formula 29.37, n is `n`, and x is `x`.

$$\mathsf{L}_n(x) = \frac{e^x}{n!} \frac{\mathrm{d}^n}{\mathrm{d}x^n} (x^n e^{-x}) \ , \quad \text{for } x \ge 0 \tag{29.37}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

29.7.6.18 Legendre polynomials [sf.cmath.legendre]

```
floating-point-type legendre(unsigned l, floating-point-type x);
float       legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);
```

1 *Effects*: These functions compute the Legendre polynomials of their respective arguments `l` and `x`.

2 *Returns*: $\mathsf{P}_\ell(x)$, where P_ℓ is given by Formula 29.38, l is `l`, and x is `x`.

$$\mathsf{P}_\ell(x) = \frac{1}{2^\ell\, \ell!} \frac{\mathrm{d}^\ell}{\mathrm{d}x^\ell} (x^2 - 1)^\ell \ , \quad \text{for } |x| \le 1 \tag{29.38}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

29.7.6.19 Riemann zeta function [sf.cmath.riemann.zeta]

```
floating-point-type riemann_zeta(floating-point-type x);
float       riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1 *Effects*: These functions compute the Riemann zeta function of their respective arguments `x`.

2 *Returns*: $\zeta(x)$, where ζ is given by Formula 29.39 and x is `x`.

$$\zeta(x) = \begin{cases} \sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\ \frac{1}{1-2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \le x \le 1 \\ 2^x \pi^{x-1} \sin(\frac{\pi x}{2}) \, \Gamma(1-x) \, \zeta(1-x), & \text{for } x < 0 \end{cases} \tag{29.39}$$

29.7.6.20 Spherical Bessel functions of the first kind [sf.cmath.sph.bessel]

```
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float       sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Bessel functions of the first kind of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{j}_n(x)$, where j_n is given by Formula 29.40, n is `n`, and x is `x`.

$$\mathsf{j}_n(x) = (\pi/2x)^{1/2} \mathsf{J}_{n+1/2}(x) \ , \quad \text{for } x \ge 0 \tag{29.40}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

4 See also 29.7.6.9.

29.7.6.21 Spherical associated Legendre functions [sf.cmath.sph.legendre]

```
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float       sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1 *Effects*: These functions compute the spherical associated Legendre functions of their respective arguments `l`, `m`, and `theta` (`theta` measured in radians).

2 *Returns*: $\mathsf{Y}_\ell^m(\theta, 0)$, where Y_ℓ^m is given by Formula 29.41, l is `l`, m is `m`, and θ is `theta`.

$$\mathsf{Y}_\ell^m(\theta, \phi) = (-1)^m \left[\frac{(2\ell+1)}{4\pi} \frac{(\ell-m)!}{(\ell+m)!} \right]^{1/2} \mathsf{P}_\ell^m(\cos\theta) e^{im\phi} \ , \quad \text{for } |m| \le \ell \tag{29.41}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `l >= 128`.

4 See also 29.7.6.3.

29.7.6.22 Spherical Neumann functions [sf.cmath.sph.neumann]

```
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float       sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1 *Effects*: These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments `n` and `x`.

2 *Returns*: $\mathsf{n}_n(x)$, where n_n is given by Formula 29.42, n is `n`, and x is `x`.

$$\mathsf{n}_n(x) = (\pi/2x)^{1/2} \mathsf{N}_{n+1/2}(x) \ , \quad \text{for } x \ge 0 \tag{29.42}$$

3 *Remarks*: The effect of calling each of these functions is implementation-defined if `n >= 128`.

29.8.2 Mathematical constants [math.constants]

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of e, $\log_2 \mathrm{e}$, $\log_{10} \mathrm{e}$, π, $\frac{1}{\pi}$, $\frac{1}{\sqrt{\pi}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni γ constant, and the golden ratio ϕ constant $\frac{1+\sqrt{5}}{2}$, respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.

29.9 Basic linear algebra algorithms [linalg]

29.9.1 Overview [linalg.overview]

1 Subclause 29.9 defines basic linear algebra algorithms. The algorithms that access the elements of arrays view those elements through `mdspan` (23.7.3).

29.9.2 Header <linalg> synopsis [linalg.syn]

}
```

29.9.3 General [linalg.general]

1 For the effects of all functions in 29.9, when the effects are described as "computes $R = E$" or "compute $R = E$" (for some R and mathematical expression E), the following apply:

(1.1) — E has the conventional mathematical meaning as written.

(1.2) — The pattern x^T should be read as "the transpose of x."

(1.3) — The pattern x^H should be read as "the conjugate transpose of x."

(1.4) — When R is the same name as a function parameter whose type is a template parameter with `Out` in its name, the intent is that the result of the computation is written to the elements of the function parameter `R`.

2 Some of the functions and types in 29.9 distinguish between the "rows" and the "columns" of a matrix. For a matrix `A` and a multidimensional index `i, j` in `A.extents()`,

(2.1) — *row* `i` of `A` is the set of elements `A[i, k1]` for all `k1` such that `i, k1` is in `A.extents()`; and

(2.2) — *column* `j` of `A` is the set of elements `A[k0, j]` for all `k0` such that `k0, j` is in `A.extents()`.

3 Some of the functions in 29.9 distinguish between the "upper triangle," "lower triangle," and "diagonal" of a matrix.

(3.1) — The *diagonal* is the set of all elements of `A` accessed by `A[i,i]` for $0 \leq$ `i` $<$ min(`A.extent(0)`, `A.extent(1)`).

(3.2) — The *upper triangle* of a matrix `A` is the set of all elements of `A` accessed by `A[i,j]` with `i` $\leq$ `j`. It includes the diagonal.

(3.3) — The *lower triangle* of `A` is the set of all elements of `A` accessed by `A[i,j]` with `i` $\geq$ `j`. It includes the diagonal.

4 For any function `F` that takes a parameter named `t`, `t` applies to accesses done through the parameter preceding `t` in the parameter list of `F`. Let `m` be such an access-modified function parameter. `F` will only access the triangle of `m` specified by `t`. For accesses of diagonal elements `m[i, i]`, `F` will use the value *`real-if-needed`*`(m[i, i])` if the name of `F` starts with `hermitian`. For accesses `m[i, j]` outside the triangle specified by `t`, `F` will use the value

(4.1) — *`conj-if-needed`*`(m[j, i])` if the name of `F` starts with `hermitian`,

(4.2) — `m[j, i]` if the name of `F` starts with `symmetric`, or

(4.3) — the additive identity if the name of `F` starts with `triangular`.

[*Example 1*: Small vector product accessing only specified triangle. It would not be a precondition violation for the non-accessed matrix element to be non-zero.

```
template<class Triangle>
void triangular_matrix_vector_2x2_product(
       mdspan<const float, extents<int, 2, 2>> m,
       Triangle t,
       mdspan<const float, extents<int, 2>> x,
       mdspan<float, extents<int, 2>> y) {

  static_assert(is_same_v<Triangle, lower_triangle_t> ||
                is_same_v<Triangle, upper_triangle_t>);

  if constexpr (is_same_v<Triangle, lower_triangle_t>) {
    y[0] = m[0,0] * x[0];       // + 0 * x[1]
    y[1] = m[1,0] * x[0] + m[1,1] * x[1];
  } else {                      // upper_triangle_t
    y[0] = m[0,0] * x[0] + m[0,1] * x[1];
    y[1] = /* 0 * x[0] + */ m[1,1] * x[1];
  }
}
```

— *end example*]

5 For any function `F` that takes a parameter named `d`, `d` applies to accesses done through the previous-of-the-previous parameter of `d` in the parameter list of `F`. Let `m` be such an access-modified function parameter. If `d` specifies that an implicit unit diagonal is to be assumed, then

(5.1) — `F` will not access the diagonal of `m`; and

(5.2) — the algorithm will interpret `m` as if it has a unit diagonal, that is, a diagonal each of whose elements behaves as a two-sided multiplicative identity (even if `m`'s value type does not have a two-sided multiplicative identity).

Otherwise, if `d` specifies that an explicit diagonal is to be assumed, then `F` will access the diagonal of `m`.

6 Within all the functions in 29.9, any calls to `abs`, `conj`, `imag`, and `real` are unqualified.

7 Two `mdspan` objects `x` and `y` *alias* each other, if they have the same extents `e`, and for every pack of integers `i` which is a multidimensional index in `e`, `x[i...]` and `y[i...]` refer to the same element.

[*Note 1*: This means that `x` and `y` view the same elements in the same order. — *end note*]

8 Two `mdspan` objects `x` and `y` *overlap* each other, if for some pack of integers `i` that is a multidimensional index in `x.extents()`, there exists a pack of integers `j` that is a multidimensional index in `y.extents()`, such that `x[i...]` and `y[j...]` refer to the same element.

[*Note 2*: Aliasing is a special case of overlapping. If `x` and `y` do not overlap, then they also do not alias each other. — *end note*]

29.9.4 Requirements [linalg.reqs]

29.9.4.1 Linear algebra value types [linalg.reqs.val]

1 Throughout 29.9, the following types are *linear algebra value types*:

(1.1) — the `value_type` type alias of any input or output `mdspan` parameter(s) of any function in 29.9; and

(1.2) — the `Scalar` template parameter (if any) of any function or class in 29.9.

2 Linear algebra value types shall model *`scalar`*.

3 A value-initialized object of linear algebra value type shall act as the additive identity.

29.9.4.2 Algorithm and class requirements [linalg.reqs.alg]

1 29.9.4.2 lists common requirements for all algorithms and classes in 29.9.

2 All of the following statements presume that the algorithm's asymptotic complexity requirements, if any, are satisfied.

(2.1) — The function may make arbitrarily many objects of any linear algebra value type, value-initializing or direct-initializing them with any existing object of that type.

(2.2) — The *triangular solve algorithms* in 29.9.14.5, 29.9.15.3, 29.9.15.6, and 29.9.15.7 either have a `BinaryDivideOp` template parameter (see 29.9.12) and a binary function object parameter `divide` of that type, or they have effects equivalent to invoking such an algorithm. Triangular solve algorithms interpret `divide(a, b)` as `a` times the multiplicative inverse of `b`. Each triangular solve algorithm uses a sequence of evaluations of `*`, `*=`, `divide`, unary `+`, binary `+`, `+=`, unary `-`, binary `-`, `-=`, and `=` operators that would produce the result specified by the algorithm's *Effects* and *Remarks* when operating on elements of a field with noncommutative multiplication. It is a precondition of the algorithm that any addend, any subtrahend, any partial sum of addends in any order (treating any difference as a sum with the second term negated), any factor, any partial product of factors respecting their order, any numerator (first argument of `divide`), any denominator (second argument of `divide`), and any assignment is a well-formed expression.

(2.3) — Each function in 29.9.13, 29.9.14, and 29.9.15 that is not a triangular solve algorithm will use a sequence of evaluations of `*`, `*=`, `+`, `+=`, and `=` operators that would produce the result specified by the algorithm's *Effects* and *Remarks* when operating on elements of a semiring with noncommutative multiplication. It is a precondition of the algorithm that any addend, any partial sum of addends in any order, any factor, any partial product of factors respecting their order, and any assignment is a well-formed expression.

(2.4) — If the function has an output `mdspan`, then all addends, subtrahends (for the triangular solve algorithms), or results of the `divide` parameter on intermediate terms (if the function takes a `divide` parameter) are assignable and convertible to the output `mdspan`'s `value_type`.

(2.5) — The function may reorder addends and partial sums arbitrarily.

[*Note 1*: Factors in each product are not reordered; multiplication is not necessarily commutative. — *end note*]

[*Note 2*: The above requirements do not prohibit implementation approaches and optimization techniques which are not user-observable. In particular, if for all input and output arguments the `value_type` is a floating-point type, implementers are free to leverage approximations, use arithmetic operations not explicitly listed above, and compute floating-point sums in any way that improves their accuracy. — *end note*]

3 [*Note 3*: For all functions in 29.9, suppose that all input and output `mdspan` have as `value_type` a floating-point type, and any `Scalar` template argument has a floating-point type. Then, functions can do all of the following:

(3.1) — compute floating-point sums in any way that improves their accuracy for arbitrary input;

(3.2) — perform additional arithmetic operations (other than those specified by the function's wording and 29.9.4.2) in order to improve performance or accuracy; and

(3.3) — use approximations (that might not be exact even if computing with real numbers), instead of computations that would be exact if it were possible to compute without rounding error;

as long as

(3.4) — the function satisfies the complexity requirements; and

(3.5) — the function is logarithmically stable, as defined in Demmel 2007[15]. Strassen's algorithm for matrix-matrix multiply is an example of a logarithmically stable algorithm.

— *end note*]

29.9.5 Tag classes [linalg.tags]

29.9.5.1 Storage order tags [linalg.tags.order]

1 The storage order tags describe the order of elements in an `mdspan` with `layout_blas_packed` (29.9.6) layout.

```
struct column_major_t {
  explicit column_major_t() = default;
};
inline constexpr column_major_t column_major{};

struct row_major_t {
  explicit row_major_t() = default;
};
inline constexpr row_major_t row_major{};
```

2 `column_major_t` indicates a column-major order, and `row_major_t` indicates a row-major order.

29.9.5.2 Triangle tags [linalg.tags.triangle]

```
struct upper_triangle_t {
  explicit upper_triangle_t() = default;
};
inline constexpr upper_triangle_t upper_triangle{};

struct lower_triangle_t {
  explicit lower_triangle_t() = default;
};
inline constexpr lower_triangle_t lower_triangle{};
```

1 These tag classes specify whether algorithms and other users of a matrix (represented as an `mdspan`) access the upper triangle (`upper_triangle_t`) or lower triangle (`lower_triangle_t`) of the matrix (see also 29.9.3). This is also subject to the restrictions of `implicit_unit_diagonal_t` if that tag is also used as a function argument; see below.

29.9.5.3 Diagonal tags [linalg.tags.diagonal]

```
struct implicit_unit_diagonal_t {
  explicit implicit_unit_diagonal_t() = default;
};
inline constexpr implicit_unit_diagonal_t implicit_unit_diagonal{};

struct explicit_diagonal_t {
  explicit explicit_diagonal_t() = default;
};
```

```
inline constexpr explicit_diagonal_t explicit_diagonal{};
```

1 These tag classes specify whether algorithms access the matrix's diagonal entries, and if not, then how algorithms interpret the matrix's implicitly represented diagonal values.

2 The `implicit_unit_diagonal_t` tag indicates that an implicit unit diagonal is to be assumed (29.9.3).

3 The `explicit_diagonal_t` tag indicates that an explicit diagonal is used (29.9.3).

29.9.6 Layouts for packed matrix types [linalg.layout.packed]

29.9.6.1 Overview [linalg.layout.packed.overview]

1 `layout_blas_packed` is an `mdspan` layout mapping policy that represents a square matrix that stores only the entries in one triangle, in a packed contiguous format. Its `Triangle` template parameter determines whether an `mdspan` with this layout stores the upper or lower triangle of the matrix. Its `StorageOrder` template parameter determines whether the layout packs the matrix's elements in column-major or row-major order.

2 A `StorageOrder` of `column_major_t` indicates column-major ordering. This packs matrix elements starting with the leftmost (least column index) column, and proceeding column by column, from the top entry (least row index).

3 A `StorageOrder` of `row_major_t` indicates row-major ordering. This packs matrix elements starting with the topmost (least row index) row, and proceeding row by row, from the leftmost (least column index) entry.

4 [*Note 1*: `layout_blas_packed` describes the data layout used by the BLAS' Symmetric Packed (SP), Hermitian Packed (HP), and Triangular Packed (TP) matrix types. — *end note*]

```
namespace std::linalg {
  template<class Triangle, class StorageOrder>
  class layout_blas_packed {
  public:
    using triangle_type = Triangle;
    using storage_order_type = StorageOrder;

    template<class Extents>
    struct mapping {
    public:
      using extents_type = Extents;
      using index_type = extents_type::index_type;
      using size_type = extents_type::size_type;
      using rank_type = extents_type::rank_type;
      using layout_type = layout_blas_packed;

      // 29.9.6.2, constructors
      constexpr mapping() noexcept = default;
      constexpr mapping(const mapping&) noexcept = default;
      constexpr mapping(const extents_type&) noexcept;
      template<class OtherExtents>
        constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
          mapping(const mapping<OtherExtents>& other) noexcept;

      constexpr mapping& operator=(const mapping&) noexcept = default;

      // 29.9.6.3, observers
      constexpr const extents_type& extents() const noexcept { return extents_; }

      constexpr index_type required_span_size() const noexcept;

      template<class Index0, class Index1>
        constexpr index_type operator() (Index0 ind0, Index1 ind1) const noexcept;

      static constexpr bool is_always_unique() noexcept {
        return (extents_type::static_extent(0) != dynamic_extent &&
                extents_type::static_extent(0) < 2) ||
               (extents_type::static_extent(1) != dynamic_extent &&
                extents_type::static_extent(1) < 2);
```

```
    }
    static constexpr bool is_always_exhaustive() noexcept { return true; }
    static constexpr bool is_always_strided() noexcept
      { return is_always_unique(); }

    constexpr bool is_unique() const noexcept {
      return extents_.extent(0) < 2;
    }
    constexpr bool is_exhaustive() const noexcept { return true; }
    constexpr bool is_strided() const noexcept {
      return extents_.extent(0) < 2;
    }

    constexpr index_type stride(rank_type) const noexcept;

    template<class OtherExtents>
      friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

  private:
    extents_type extents_{};      // exposition only
  };
 };
}
```

5 *Mandates*:

(5.1) — `Triangle` is either `upper_triangle_t` or `lower_triangle_t`,

(5.2) — `StorageOrder` is either `column_major_t` or `row_major_t`,

(5.3) — `Extents` is a specialization of `std::extents`,

(5.4) — `Extents::rank()` equals 2,

(5.5) — one of

```
extents_type::static_extent(0) == dynamic_extent,
extents_type::static_extent(1) == dynamic_extent, or
extents_type::static_extent(0) == extents_type::static_extent(1)
```

is `true`, and

(5.6) — if `Extents::rank_dynamic() == 0` is `true`, let N_s be equal to `Extents::static_extent(0)`; then, $N_s \times (N_s + 1)$ is representable as a value of type `index_type`.

6 `layout_blas_packed<T, SO>::mapping<E>` is a trivially copyable type that models `regular` for each `T`, `SO`, and `E`.

29.9.6.2 Constructors [linalg.layout.packed.cons]

```
constexpr mapping(const extents_type& e) noexcept;
```

1 *Preconditions*:

(1.1) — Let N be equal to `e.extent(0)`. Then, $N \times (N + 1)$ is representable as a value of type `index_type` (6.9.2).

(1.2) — `e.extent(0)` equals `e.extent(1)`.

2 *Effects*: Direct-non-list-initializes *`extents_`* with `e`.

```
template<class OtherExtents>
  explicit(!is_convertible_v<OtherExtents, extents_type>)
    constexpr mapping(const mapping<OtherExtents>& other) noexcept;
```

3 *Constraints*: `is_constructible_v<extents_type, OtherExtents>` is `true`.

4 *Preconditions*: Let N be `other.extents().extent(0)`. Then, $N \times (N + 1)$ is representable as a value of type `index_type` (6.9.2).

5 *Effects*: Direct-non-list-initializes *`extents_`* with `other.extents()`.

29.9.6.3 Observers [linalg.layout.packed.obs]

```
constexpr index_type required_span_size() const noexcept;
```

1 *Returns*: *extents_*.extent(0) * (*extents_*.extent(0) + 1)/2.

[*Note 1*: For example, a 5 x 5 packed matrix only stores 15 matrix elements. — *end note*]

```
template<class Index0, class Index1>
  constexpr index_type operator() (Index0 ind0, Index1 ind1) const noexcept;
```

2 *Constraints*:

(2.1) — is_convertible_v<Index0, index_type> is true,

(2.2) — is_convertible_v<Index1, index_type> is true,

(2.3) — is_nothrow_constructible_v<index_type, Index0> is true, and

(2.4) — is_nothrow_constructible_v<index_type, Index1> is true.

3 Let i be extents_type::*index-cast*(ind0), and let j be extents_type::*index-cast*(ind1).

4 *Preconditions*: i, j is a multidimensional index in *extents_* (23.7.3.1).

5 *Returns*: Let N be *extents_*.extent(0). Then

(5.1) — (*this)(j, i) if i > j is true; otherwise

(5.2) — i + j * (j + 1)/2 if

```
is_same_v<StorageOrder, column_major_t> && is_same_v<Triangle, upper_triangle_t>
```

is true or

```
is_same_v<StorageOrder, row_major_t> && is_same_v<Triangle, lower_triangle_t>
```

is true; otherwise

(5.3) — j + N * i - i * (i + 1)/2.

```
constexpr index_type stride(rank_type r) const noexcept;
```

6 *Preconditions*:

(6.1) — is_strided() is true, and

(6.2) — r < extents_type::rank() is true.

7 *Returns*: 1.

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;
```

8 *Effects*: Equivalent to: return x.extents() == y.extents();

29.9.7 Exposition-only helpers [linalg.helpers]

29.9.7.1 *abs-if-needed* [linalg.helpers.abs]

1 The name *abs-if-needed* denotes an exposition-only function object. The expression *abs-if-needed*(E) for a subexpression E whose type is T is expression-equivalent to:

(1.1) — E if T is an unsigned integer;

(1.2) — otherwise, std::abs(E) if T is an arithmetic type,

(1.3) — otherwise, abs(E), if that expression is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U abs(U) = delete;
```

If the function selected by overload resolution does not return the absolute value of its input, the program is ill-formed, no diagnostic required.

29.9.7.2 *conj-if-needed* [linalg.helpers.conj]

1 The name *conj-if-needed* denotes an exposition-only function object. The expression *conj-if-needed*(E) for a subexpression E whose type is T is expression-equivalent to:

(1.1) — `conj(E)`, if `T` is not an arithmetic type and the expression `conj(E)` is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U conj(const U&) = delete;
```

If the function selected by overload resolution does not return the complex conjugate of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, `E`.

29.9.7.3 *real-if-needed* [linalg.helpers.real]

1 The name *real-if-needed* denotes an exposition-only function object. The expression *real-if-needed*`(E)` for a subexpression `E` whose type is `T` is expression-equivalent to:

(1.1) — `real(E)`, if `T` is not an arithmetic type and the expression `real(E)` is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U real(const U&) = delete;
```

If the function selected by overload resolution does not return the real part of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, `E`.

29.9.7.4 *imag-if-needed* [linalg.helpers.imag]

1 The name *imag-if-needed* denotes an exposition-only function object. The expression *imag-if-needed*`(E)` for a subexpression `E` whose type is `T` is expression-equivalent to:

(1.1) — `imag(E)`, if `T` is not an arithmetic type and the expression `imag(E)` is valid, with overload resolution performed in a context that includes the declaration

```
template<class U> U imag(const U&) = delete;
```

If the function selected by overload resolution does not return the imaginary part of its input, the program is ill-formed, no diagnostic required;

(1.2) — otherwise, `((void)E, T{})`.

29.9.7.5 Argument concepts [linalg.helpers.concepts]

1 The exposition-only concepts defined in this section constrain the algorithms in 29.9.

```
template<class T>
  constexpr bool is-mdspan = false;

template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr bool is-mdspan<mdspan<ElementType, Extents, Layout, Accessor>> = true;

template<class T>
  concept in-vector =
    is-mdspan<T> && T::rank() == 1;

template<class T>
  concept out-vector =
    is-mdspan<T> && T::rank() == 1 &&

```

2 If a function in 29.9 accesses the elements of a parameter constrained by *in-vector*, *in-matrix*, or *in-object*, those accesses will not modify the elements.

3 Unless explicitly permitted, any *inout-vector*, *inout-matrix*, *inout-object*, *out-vector*, *out-matrix*, *out-object*, or *possibly-packed-out-matrix* parameter of a function in 29.9 shall not overlap any other `mdspan` parameter of the function.

29.9.7.6 Mandates [linalg.helpers.mandates]

1 [*Note 1*: These exposition-only helper functions use the less constraining input concepts even for the output arguments, because the additional constraint for assignability of elements is not necessary, and they are sometimes used in a context where the third argument is an input type too. — *end note*]

```
template<class MDS1, class MDS2>
  requires(is-mdspan<MDS1> && is-mdspan<MDS2>)
  constexpr
  bool compatible-static-extents(size_t r1, size_t r2) {          // exposition only
    return MDS1::static_extent(r1) == dynamic_extent ||
           MDS2::static_extent(r2) == dynamic_extent ||
           MDS1::static_extent(r1) == MDS2::static_extent(r2);
  }

template<in-vector In1, in-vector In2, in-vector Out>
  constexpr bool possibly-addable() {                             // exposition only
    return compatible-static-extents<Out, In1>(0, 0) &&
           compatible-static-extents<Out, In2>(0, 0) &&
           compatible-static-extents<In1, In2>(0, 0);
  }
```

©ISO/IEC

```

  return out_vec.extent(0) == in_mat.extent(1) && in_mat.extent(0) == in_vec.extent(0);
}

constexpr bool multipliable(                                   // exposition only
  const in-matrix auto& in_mat1, const in-matrix auto& in_mat2, const in-matrix auto& out_mat) {
  return out_mat.extent(0) == in_mat1.extent(0) && out_mat.extent(1) == in_mat2.extent(1) &&
         in_mat1.extent(1) == in_mat2.extent(0);
}
```

29.9.8 Scaled in-place transformation [linalg.scaled]

29.9.8.1 Introduction [linalg.scaled.intro]

1 The `scaled` function takes a value `alpha` and an `mdspan` `x`, and returns a new read-only `mdspan` that represents the elementwise product of `alpha` with each element of `x`.

[*Example 1*:

```
using Vec = mdspan<double, dextents<size_t, 1>>;

// z = alpha * x + y
void z_equals_alpha_times_x_plus_y(double alpha, Vec x, Vec y, Vec z) {
  add(scaled(alpha, x), y, z);
}

// z = alpha * x + beta * y
void z_equals_alpha_times_x_plus_beta_times_y(double alpha, Vec x, double beta, Vec y, Vec z) {
  add(scaled(alpha, x), scaled(beta, y), z);
}
```

— *end example*]

29.9.8.2 Class template `scaled_accessor` [linalg.scaled.scaledaccessor]

1 The class template `scaled_accessor` is an `mdspan` accessor policy which upon access produces scaled elements. It is part of the implementation of `scaled` (29.9.8.3).

```
namespace std::linalg {
  template<class ScalingFactor, class NestedAccessor>
  class scaled_accessor {
  public:
    using element_type =
      const decltype(declval<ScalingFactor>() *
                     declval<typename NestedAccessor::element_type>());
    using reference = remove_const_t<element_type>;
    using data_handle_type = NestedAccessor::data_handle_type;
    using offset_policy = scaled_accessor<ScalingFactor, typename NestedAccessor::offset_policy>;

    constexpr scaled_accessor() = default;
    template<class OtherNestedAccessor>
      explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
        constexpr scaled_accessor(const scaled_accessor<ScalingFactor,
                                                        OtherNestedAccessor>& other);
    constexpr scaled_accessor(const ScalingFactor& s, const NestedAccessor& a);

    constexpr reference access(data_handle_type p, size_t i) const;
    constexpr offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;

    constexpr const ScalingFactor& scaling_factor() const noexcept { return scaling-factor; }
    constexpr const NestedAccessor& nested_accessor() const noexcept { return nested-accessor; }

  private:
    ScalingFactor scaling-factor{};                    // exposition only
    NestedAccessor nested-accessor{};                  // exposition only
  };
}
```

2 *Mandates*:

(2.1) — `element_type` is valid and denotes a type,

(2.2) — `is_copy_constructible_v<reference>` is `true`,

(2.3) — `is_reference_v<element_type>` is `false`,

(2.4) — `ScalingFactor` models `semiregular`, and

(2.5) — `NestedAccessor` meets the accessor policy requirements (23.7.3.5.2).

```
template<class OtherNestedAccessor>
  explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
    constexpr scaled_accessor(const scaled_accessor<ScalingFactor, OtherNestedAccessor>& other);
```

3 *Constraints*: `is_constructible_v<NestedAccessor, const OtherNestedAccessor&>` is `true`.

4 *Effects*:

(4.1) — Direct-non-list-initializes *`scaling-factor`* with `other.scaling_factor()`, and

(4.2) — direct-non-list-initializes *`nested-accessor`* with `other.nested_accessor()`.

```
constexpr scaled_accessor(const ScalingFactor& s, const NestedAccessor& a);
```

5 *Effects*:

(5.1) — Direct-non-list-initializes *`scaling-factor`* with `s`, and

(5.2) — direct-non-list-initializes *`nested-accessor`* with `a`.

```
constexpr reference access(data_handle_type p, size_t i) const;
```

6 *Returns*:

```
scaling_factor() * typename NestedAccessor::element_type(nested-accessor.access(p, i))
```

```
constexpr offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;
```

7 *Returns*: *`nested-accessor`*`.offset(p, i)`.

29.9.8.3 Function template `scaled` [linalg.scaled.scaled]

1 The `scaled` function template takes a scaling factor `alpha` and an `mdspan` `x`, and returns a new read-only `mdspan` with the same domain as `x`, that represents the elementwise product of `alpha` with each element of `x`.

```
template<class ScalingFactor,
         class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto scaled(ScalingFactor alpha, mdspan<ElementType, Extents, Layout, Accessor> x);
```

2 Let `SA` be `scaled_accessor<ScalingFactor, Accessor>`.

3 *Returns*:

```
mdspan<typename SA::element_type, Extents, Layout, SA>(x.data_handle(), x.mapping(),
                                                       SA(alpha, x.accessor()))
```

4 [*Example 1*:

```
void test_scaled(mdspan<double, extents<int, 10>> x)
{
  auto x_scaled = scaled(5.0, x);
  for (int i = 0; i < x.extent(0); ++i) {
    assert(x_scaled[i] == 5.0 * x[i]);
  }
}
```

— *end example*]

29.9.9 Conjugated in-place transformation [linalg.conj]

29.9.9.1 Introduction [linalg.conj.intro]

1 The `conjugated` function takes an `mdspan` `x`, and returns a new read-only `mdspan` `y` with the same domain as `x`, whose elements are the complex conjugates of the corresponding elements of `x`.

29.9.9.2 Class template `conjugated_accessor` [linalg.conj.conjugatedaccessor]

1 The class template `conjugated_accessor` is an `mdspan` accessor policy which upon access produces conjugate elements. It is part of the implementation of `conjugated` (29.9.9.3).

```
namespace std::linalg {
  template<class NestedAccessor>
  class conjugated_accessor {
  public:
    using element_type =
      const decltype(conj-if-needed(declval<typename NestedAccessor::element_type>()));
```

```
    using reference = remove_const_t<element_type>;
    using data_handle_type = NestedAccessor::data_handle_type;
    using offset_policy = conjugated_accessor<typename NestedAccessor::offset_policy>;

    constexpr conjugated_accessor() = default;
    constexpr conjugated_accessor(const NestedAccessor& acc);
    template<class OtherNestedAccessor>
      explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
      constexpr conjugated_accessor(const conjugated_accessor<OtherNestedAccessor>& other);

    constexpr reference access(data_handle_type p, size_t i) const;

    constexpr typename offset_policy::data_handle_type
      offset(data_handle_type p, size_t i) const;

    constexpr const NestedAccessor& nested_accessor() const noexcept { return nested-accessor_; }

  private:
    NestedAccessor nested-accessor_{};                    // exposition only
  };
}
```

2 *Mandates*:

(2.1) — `element_type` is valid and denotes a type,

(2.2) — `is_copy_constructible_v<reference>` is `true`,

(2.3) — `is_reference_v<element_type>` is `false`, and

(2.4) — `NestedAccessor` meets the accessor policy requirements (23.7.3.5.2).

```
constexpr conjugated_accessor(const NestedAccessor& acc);
```

3 *Effects*: Direct-non-list-initializes *nested-accessor_* with `acc`.

```
template<class OtherNestedAccessor>
  explicit(!is_convertible_v<OtherNestedAccessor, NestedAccessor>)
    constexpr conjugated_accessor(const conjugated_accessor<OtherNestedAccessor>& other);
```

4 *Constraints*: `is_constructible_v<NestedAccessor, const OtherNestedAccessor&>` is `true`.

5 *Effects*: Direct-non-list-initializes *nested-accessor_* with `other.nested_accessor()`.

```
constexpr reference access(data_handle_type p, size_t i) const;
```

6 *Returns*:

conj-if-needed`(typename NestedAccessor::element_type(`*nested-accessor_*`.access(p, i)))`

```
constexpr typename offset_policy::data_handle_type offset(data_handle_type p, size_t i) const;
```

7 *Returns*: *nested-accessor_*`.offset(p, i)`.

29.9.9.3 Function template `conjugated` [linalg.conj.conjugated]

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto conjugated(mdspan<ElementType, Extents, Layout, Accessor> a);
```

1 Let `A` be

(1.1) — `remove_cvref_t<decltype(a.accessor().nested_accessor())>` if `Accessor` is a specialization of `conjugated_accessor`;

(1.2) — otherwise, `Accessor` if `remove_cvref_t<ElementType>` is an arithmetic type;

(1.3) — otherwise, `conjugated_accessor<Accessor>` if the expression `conj(E)` is valid for any subexpression `E` whose type is `remove_cvref_t<ElementType>` with overload resolution performed in a context that includes the declaration `template<class U> U conj(const U&) = delete;`;

(1.4) — otherwise, `Accessor`.

©ISO/IEC

2 *Returns*: Let MD be mdspan<typename A::element_type, Extents, Layout, A>.

(2.1) — MD(a.data_handle(), a.mapping(), a.accessor().nested_accessor()) if Accessor is a specialization of conjugated_accessor;

(2.2) — otherwise, a, if is_same_v<A, Accessor> is true;

(2.3) — otherwise, MD(a.data_handle(), a.mapping(), conjugated_accessor(a.accessor())).

3 [*Example 1*:

```
void test_conjugated_complex(mdspan<complex<double>, extents<int, 10>> a) {
  auto a_conj = conjugated(a);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj[i] == conj(a[i]);
  }
  auto a_conj_conj = conjugated(a_conj);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj_conj[i] == a[i]);
  }
}

void test_conjugated_real(mdspan<double, extents<int, 10>> a) {
  auto a_conj = conjugated(a);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj[i] == a[i]);
  }
  auto a_conj_conj = conjugated(a_conj);
  for (int i = 0; i < a.extent(0); ++i) {
    assert(a_conj_conj[i] == a[i]);
  }
}
```

— *end example*]

29.9.10 Transpose in-place transformation [linalg.transp]

29.9.10.1 Introduction [linalg.transp.intro]

1 layout_transpose is an mdspan layout mapping policy that swaps the two indices, extents, and strides of any unique mdspan layout mapping policy.

2 The transposed function takes an mdspan representing a matrix, and returns a new mdspan representing the transpose of the input matrix.

29.9.10.2 Exposition-only helpers for layout_transpose and transposed [linalg.transp.helpers]

1 The exposition-only *transpose-extents* function takes an extents object representing the extents of a matrix, and returns a new extents object representing the extents of the transpose of the matrix.

2 The exposition-only alias template *transpose-extents-t*<InputExtents> gives the type of *transpose-extents*(e) for a given extents object e of type InputExtents.

```
template<class IndexType, size_t InputExtent0, size_t InputExtent1>
  constexpr extents<IndexType, InputExtent1, InputExtent0>
    transpose-extents(const extents<IndexType, InputExtent0, InputExtent1>& in);   // exposition only
```

3 *Returns*: extents<IndexType, InputExtent1, InputExtent0>(in.extent(1), in.extent(0)).

```
template<class InputExtents>
  using transpose-extents-t =
    decltype(transpose-extents(declval<InputExtents>()));        // exposition only
```

29.9.10.3 Class template layout_transpose [linalg.transp.layout.transpose]

1 layout_transpose is an mdspan layout mapping policy that swaps the two indices, extents, and strides of any mdspan layout mapping policy.

```
namespace std::linalg {
  template<class Layout>
  class layout_transpose {
  public:
    using nested_layout_type = Layout;
```

```
    template<class Extents>
    struct mapping {
    private:
      using nested-mapping-type =
        Layout::template mapping<transpose-extents-t<Extents>>;  // exposition only

    public:
      using extents_type = Extents;
      using index_type = extents_type::index_type;
      using size_type = extents_type::size_type;
      using rank_type = extents_type::rank_type;
      using layout_type = layout_transpose;

      constexpr explicit mapping(const nested-mapping-type&);

      constexpr const extents_type& extents() const noexcept { return extents_; }

      constexpr index_type required_span_size() const
        { return nested-mapping_.required_span_size(); }

      template<class Index0, class Index1>
        constexpr index_type operator()(Index0 ind0, Index1 ind1) const
        { return nested-mapping_(ind1, ind0); }

      constexpr const nested-mapping-type& nested_mapping() const noexcept
        { return nested-mapping_; }

      static constexpr bool is_always_unique() noexcept
        { return nested-mapping-type::is_always_unique(); }
      static constexpr bool is_always_exhaustive() noexcept
        { return nested-mapping-type::is_always_exhaustive(); }
      static constexpr bool is_always_strided() noexcept
        { return nested-mapping-type::is_always_strided(); }

      constexpr bool is_unique() const { return nested-mapping_.is_unique(); }
      constexpr bool is_exhaustive() const { return nested-mapping_.is_exhaustive(); }
      constexpr bool is_strided() const { return nested-mapping_.is_strided(); }

      constexpr index_type stride(size_t r) const;

      template<class OtherExtents>
        friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y);

    private:
      nested-mapping-type nested-mapping_;                    // exposition only
      extents_type extents_;                                  // exposition only
    };
  };
}
```

2 `Layout` shall meet the layout mapping policy requirements (23.7.3.4.3).

3 *Mandates*:

(3.1) — `Extents` is a specialization of `std::extents`, and

(3.2) — `Extents::rank()` equals 2.

`constexpr explicit mapping(const nested-mapping-type& map);`

4 *Effects*:

(4.1) — Initializes *nested-mapping_* with `map`, and

(4.2) — initializes *extents_* with *transpose-extents*`(map.extents())`.

```
constexpr index_type stride(size_t r) const;
```

5 *Preconditions*:

(5.1) — `is_strided()` is `true`, and

(5.2) — `r < 2` is `true`.

6 *Returns*: *`nested-mapping_`*`.stride(r == 0 ? 1 : 0)`.

```
template<class OtherExtents>
  friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y);
```

7 *Constraints*: The expression `x.`*`nested-mapping_`*` == y.`*`nested-mapping_`* is well-formed and its result is convertible to `bool`.

8 *Returns*: `x.`*`nested-mapping_`*` == y.`*`nested-mapping_`*.

29.9.10.4 Function template `transposed` [linalg.transp.transposed]

1 The `transposed` function takes a rank-2 `mdspan` representing a matrix, and returns a new `mdspan` representing the input matrix's transpose. The input matrix's data are not modified, and the returned `mdspan` accesses the input matrix's data in place.

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto transposed(mdspan<ElementType, Extents, Layout, Accessor> a);
```

2 *Mandates*: `Extents::rank() == 2` is `true`.

3 Let `ReturnExtents` be *`transpose-extents-t`*`<Extents>`. Let `R` be `mdspan<ElementType, ReturnExtents, ReturnLayout, Accessor>`, where `ReturnLayout` is:

(3.1) — `layout_right` if `Layout` is `layout_left`;

(3.2) — otherwise, `layout_left` if `Layout` is `layout_right`;

(3.3) — otherwise, `layout_right_padded<PaddingValue>` if `Layout` is `layout_left_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(3.4) — otherwise, `layout_left_padded<PaddingValue>` if `Layout` is `layout_right_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(3.5) — otherwise, `layout_stride` if `Layout` is `layout_stride`;

(3.6) — otherwise, `layout_blas_packed<OppositeTriangle, OppositeStorageOrder>`, if `Layout` is `layout_blas_packed<Triangle, StorageOrder>` for some `Triangle` and `StorageOrder`, where

(3.6.1) — `OppositeTriangle` is

```
conditional_t<is_same_v<Triangle, upper_triangle_t>,
              lower_triangle_t, upper_triangle_t>
```

and

(3.6.2) — `OppositeStorageOrder` is

```
conditional_t<is_same_v<StorageOrder, column_major_t>, row_major_t, column_major_t>
```

(3.7) — otherwise, `NestedLayout` if `Layout` is `layout_transpose<NestedLayout>` for some `NestedLayout`;

(3.8) — otherwise, `layout_transpose<Layout>`.

4 *Returns*: With `ReturnMapping` being the type `typename ReturnLayout::template mapping<ReturnExtents>`:

(4.1) — if `Layout` is `layout_left`, `layout_right`, or a specialization of `layout_blas_packed`,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents())),
  a.accessor())
```

(4.2) — otherwise,

```
R(a.data_handle(), ReturnMapping(transpose-extents(a.mapping().extents()),
  a.mapping().stride(1)), a.accessor())
```

if `Layout` is `layout_left_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(4.3) — otherwise,

`R(a.data_handle(), ReturnMapping(`*transpose-extents*`(a.mapping().extents()), a.mapping().stride(0)), a.accessor())`

if `Layout` is `layout_right_padded<PaddingValue>` for some `size_t` value `PaddingValue`;

(4.4) — otherwise, if `Layout` is `layout_stride`,

`R(a.data_handle(), ReturnMapping(`*transpose-extents*`(a.mapping().extents()), array{a.mapping().stride(1), a.mapping().stride(0)}), a.accessor())`

(4.5) — otherwise, if `Layout` is a specialization of `layout_transpose`,

`R(a.data_handle(), a.mapping().nested_mapping(), a.accessor())`

(4.6) — otherwise,

`R(a.data_handle(), ReturnMapping(a.mapping()), a.accessor())`

5 [*Example 1*:

```
void test_transposed(mdspan<double, extents<size_t, 3, 4>> a) {
  const auto num_rows = a.extent(0);
  const auto num_cols = a.extent(1);

  auto a_t = transposed(a);
  assert(num_rows == a_t.extent(1));
  assert(num_cols == a_t.extent(0));
  assert(a.stride(0) == a_t.stride(1));
  assert(a.stride(1) == a_t.stride(0));

  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == a_t[col, row]);
    }
  }

  auto a_t_t = transposed(a_t);
  assert(num_rows == a_t_t.extent(0));
  assert(num_cols == a_t_t.extent(1));
  assert(a.stride(0) == a_t_t.stride(0));
  assert(a.stride(1) == a_t_t.stride(1));

  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == a_t_t[row, col]);
    }
  }
}
```

— *end example*]

29.9.11 Conjugate transpose in-place transform [linalg.conjtransposed]

1 The `conjugate_transposed` function returns a conjugate transpose view of an object. This combines the effects of `transposed` and `conjugated`.

```
template<class ElementType, class Extents, class Layout, class Accessor>
  constexpr auto conjugate_transposed(mdspan<ElementType, Extents, Layout, Accessor> a);
```

2 *Effects*: Equivalent to: `return conjugated(transposed(a));`

3 [*Example 1*:

```
void test_conjugate_transposed(mdspan<complex<double>, extents<size_t, 3, 4>> a) {
  const auto num_rows = a.extent(0);
  const auto num_cols = a.extent(1);

  auto a_ct = conjugate_transposed(a);
  assert(num_rows == a_ct.extent(1));
  assert(num_cols == a_ct.extent(0));
  assert(a.stride(0) == a_ct.stride(1));
  assert(a.stride(1) == a_ct.stride(0));
```

```
  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == conj(a_ct[col, row]));
    }
  }

  auto a_ct_ct = conjugate_transposed(a_ct);
  assert(num_rows == a_ct_ct.extent(0));
  assert(num_cols == a_ct_ct.extent(1));
  assert(a.stride(0) == a_ct_ct.stride(0));
  assert(a.stride(1) == a_ct_ct.stride(1));

  for (size_t row = 0; row < num_rows; ++row) {
    for (size_t col = 0; col < num_rows; ++col) {
      assert(a[row, col] == a_ct_ct[row, col]);
      assert(conj(a_ct[col, row]) == a_ct_ct[row, col]);
    }
  }
}
```

— *end example*]

29.9.12 Algorithm requirements based on template parameter name[linalg.algs.reqs]

1 Throughout 29.9.13, 29.9.14, and 29.9.15, where the template parameters are not constrained, the names of template parameters are used to express the following constraints.

(1.1) — `is_execution_policy<ExecutionPolicy>::value` is `true` (26.3.6.2).

(1.2) — `Real` is any type such that `complex<Real>` is specified (29.4.1).

(1.3) — `Triangle` is either `upper_triangle_t` or `lower_triangle_t`.

(1.4) — `DiagonalStorage` is either `implicit_unit_diagonal_t` or `explicit_diagonal_t`.

[*Note 1*: Function templates that have a template parameter named `ExecutionPolicy` are parallel algorithms (26.3.1). — *end note*]

29.9.13 BLAS 1 algorithms [linalg.algs.blas1]

29.9.13.1 Complexity [linalg.algs.blas1.complexity]

1 *Complexity*: All algorithms in 29.9.13 with `mdspan` parameters perform a count of `mdspan` array accesses and arithmetic operations that is linear in the maximum product of extents of any `mdspan` parameter.

29.9.13.2 Givens rotations [linalg.algs.blas1.givens]

29.9.13.2.1 Compute Givens rotation [linalg.algs.blas1.givens.lartg]

```
template<class Real>
  setup_givens_rotation_result<Real> setup_givens_rotation(Real a, Real b) noexcept;

template<class Real>
  setup_givens_rotation_result<complex<Real>>
    setup_givens_rotation(complex<Real> a, complex<Real> b) noexcept;
```

1 These functions compute the Givens plane rotation represented by the two values c and s such that the 2 x 2 system of equations

$$\begin{bmatrix} c & s \\ -\overline{s} & c \end{bmatrix} \cdot \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} r \\ 0 \end{bmatrix}$$

holds, where c is always a real scalar, and $c^2 + |s|^2 = 1$. That is, c and s represent a 2 x 2 matrix, that when multiplied by the right by the input vector whose components are a and b, produces a result vector whose first component r is the Euclidean norm of the input vector, and whose second component is zero.

[*Note 1*: These functions correspond to the LAPACK function `xLARTG`[19]. — *end note*]

2 *Returns*: `c, s, r`, where `c` and `s` form the Givens plane rotation corresponding to the input `a` and `b`, and `r` is the Euclidean norm of the two-component vector formed by `a` and `b`.

29.9.13.2.2 Apply a computed Givens rotation to vectors [linalg.algs.blas1.givens.rot]

```
template<inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(InOutVec1 x, InOutVec2 y, Real c, Real s);
template<class ExecutionPolicy, inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(ExecutionPolicy&& exec,
                             InOutVec1 x, InOutVec2 y, Real c, Real s);
template<inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(InOutVec1 x, InOutVec2 y, Real c, complex<Real> s);
template<class ExecutionPolicy, inout-vector InOutVec1, inout-vector InOutVec2, class Real>
  void apply_givens_rotation(ExecutionPolicy&& exec,
                             InOutVec1 x, InOutVec2 y, Real c, complex<Real> s);
```

1 [*Note 1*: These functions correspond to the BLAS function `xROT`[16]. — *end note*]

2 *Mandates*: *compatible-static-extents*`<InOutVec1, InOutVec2>(0, 0)` is `true`.

3 *Preconditions*: `x.extent(0)` equals `y.extent(0)`.

4 *Effects*: Applies the plane rotation specified by `c` and `s` to the input vectors `x` and `y`, as if the rotation were a 2 x 2 matrix and the input vectors were successive rows of a matrix with two rows.

29.9.13.3 Swap matrix or vector elements [linalg.algs.blas1.swap]

```
template<inout-object InOutObj1, inout-object InOutObj2>
  void swap_elements(InOutObj1 x, InOutObj2 y);
template<class ExecutionPolicy, inout-object InOutObj1, inout-object InOutObj2>
  void swap_elements(ExecutionPolicy&& exec, InOutObj1 x, InOutObj2 y);
```

1 [*Note 1*: These functions correspond to the BLAS function `xSWAP`[16]. — *end note*]

2 *Constraints*: `x.rank()` equals `y.rank()`.

3 *Mandates*: For all `r` in the range $[0, \texttt{x.rank()})$,

```
  compatible-static-extents<InOutObj1, InOutObj2>(r, r)
```

is `true`.

4 *Preconditions*: `x.extents()` equals `y.extents()`.

5 *Effects*: Swaps all corresponding elements of `x` and `y`.

29.9.13.4 Multiply the elements of an object in place by a scalar [linalg.algs.blas1.scal]

```
template<scalar Scalar, inout-object InOutObj>
  void scale(Scalar alpha, InOutObj x);
template<class ExecutionPolicy, scalar Scalar, inout-object InOutObj>
  void scale(ExecutionPolicy&& exec, Scalar alpha, InOutObj x);
```

1 [*Note 1*: These functions correspond to the BLAS function `xSCAL`[16]. — *end note*]

2 *Effects*: Overwrites x with the result of computing the elementwise multiplication αx, where the scalar α is `alpha`.

29.9.13.5 Copy elements of one matrix or vector into another [linalg.algs.blas1.copy]

```
template<in-object InObj, out-object OutObj>
  void copy(InObj x, OutObj y);
template<class ExecutionPolicy, in-object InObj, out-object OutObj>
  void copy(ExecutionPolicy&& exec, InObj x, OutObj y);
```

1 [*Note 1*: These functions correspond to the BLAS function `xCOPY`[16]. — *end note*]

2 *Constraints*: `x.rank()` equals `y.rank()`.

3 *Mandates*: For all `r` in the range $[0, \texttt{x.rank()})$,

```
  compatible-static-extents<InObj, OutObj>(r, r)
```

is `true`.

4 *Preconditions*: `x.extents()` equals `y.extents()`.

5 *Effects*: Assigns each element of x to the corresponding element of y.

29.9.13.6 Add vectors or matrices elementwise [linalg.algs.blas1.add]

```
template<in-object InObj1, in-object InObj2, out-object OutObj>
  void add(InObj1 x, InObj2 y, OutObj z);
template<class ExecutionPolicy, in-object InObj1, in-object InObj2, out-object OutObj>
  void add(ExecutionPolicy&& exec,
           InObj1 x, InObj2 y, OutObj z);
```

1 [*Note 1*: These functions correspond to the BLAS function `xAXPY`[16]. — *end note*]

2 *Constraints*: `x.rank()`, `y.rank()`, and `z.rank()` are all equal.

3 *Mandates*: *`possibly-addable`*`<InObj1, InObj2, OutObj>()` is `true`.

4 *Preconditions*: *`addable`*`(x,y,z)` is `true`.

5 *Effects*: Computes $z = x + y$.

6 *Remarks*: `z` may alias `x` or `y`.

29.9.13.7 Dot product of two vectors [linalg.algs.blas1.dot]

1 [*Note 1*: The functions in this section correspond to the BLAS functions `xDOT`, `xDOTU`, and `xDOTC`[16]. — *end note*]

2 The following elements apply to all functions in 29.9.13.7.

3 *Mandates*: *`compatible-static-extents`*`<InVec1, InVec2>(0, 0)` is `true`.

4 *Preconditions*: `v1.extent(0)` equals `v2.extent(0)`.

```
template<in-vector InVec1, in-vector InVec2, scalar Scalar>
  Scalar dot(InVec1 v1, InVec2 v2, Scalar init);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, scalar Scalar>
  Scalar dot(ExecutionPolicy&& exec,
             InVec1 v1, InVec2 v2, Scalar init);
```

5 These functions compute a non-conjugated dot product with an explicitly specified result type.

6 *Returns*: Let `N` be `v1.extent(0)`.

(6.1) — `init` if `N` is zero;

(6.2) — otherwise, *`GENERALIZED_SUM`*`(plus<>(), init, v1[0]*v2[0], ..., v1[N-1]*v2[N-1])`.

7 *Remarks*: If `InVec1::value_type`, `InVec2::value_type`, and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InVec1::value_type` or `InVec2::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-vector InVec1, in-vector InVec2>
  auto dot(InVec1 v1, InVec2 v2);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2>
  auto dot(ExecutionPolicy&& exec,
           InVec1 v1, InVec2 v2);
```

8 These functions compute a non-conjugated dot product with a default result type.

9 *Effects*: Let `T` be `decltype(declval<typename InVec1::value_type>() * declval<typename InVec2::value_type>())`. Then,

(9.1) — the two-parameter overload is equivalent to:

```
return dot(v1, v2, T{});
```

and

(9.2) — the three-parameter overload is equivalent to:

```
return dot(std::forward<ExecutionPolicy>(exec), v1, v2, T{});
```

```
template<in-vector InVec1, in-vector InVec2, scalar Scalar>
  Scalar dotc(InVec1 v1, InVec2 v2, Scalar init);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, scalar Scalar>
  Scalar dotc(ExecutionPolicy&& exec,
              InVec1 v1, InVec2 v2, Scalar init);
```

10 These functions compute a conjugated dot product with an explicitly specified result type.

11 *Effects*:

(11.1) — The three-parameter overload is equivalent to:

```
return dot(conjugated(v1), v2, init);
```

and

(11.2) — the four-parameter overload is equivalent to:

```
return dot(std::forward<ExecutionPolicy>(exec), conjugated(v1), v2, init);
```

```
template<in-vector InVec1, in-vector InVec2>
  auto dotc(InVec1 v1, InVec2 v2);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2>
  auto dotc(ExecutionPolicy&& exec,
            InVec1 v1, InVec2 v2);
```

12 These functions compute a conjugated dot product with a default result type.

13 *Effects*: Let `T` be `decltype(conj-if-needed(declval<typename InVec1::value_type>()) * declval<typename InVec2::value_type>())`. Then,

(13.1) — the two-parameter overload is equivalent to:

```
return dotc(v1, v2, T{});
```

and

(13.2) — the three-parameter overload is equivalent to

```
return dotc(std::forward<ExecutionPolicy>(exec), v1, v2, T{});
```

29.9.13.8 Euclidean norm of a vector [linalg.algs.blas1.nrm2]

```
template<in-vector InVec, scalar Scalar>
  Scalar vector_two_norm(InVec v, Scalar init);
template<class ExecutionPolicy, in-vector InVec, scalar Scalar>
  Scalar vector_two_norm(ExecutionPolicy&& exec, InVec v, Scalar init);
```

1 [*Note 1*: These functions correspond to the BLAS function `xNRM2`[16]. — *end note*]

2 *Mandates*: `InVec::value_type` and `Scalar` are either a floating-point type, or a specialization of `complex`. Let `a` be *`abs-if-needed`*`(declval<typename InVec::value_type>())` and let `init_abs` be *`abs-if-needed`*`(init)`. Then, `decltype(init_abs * init_abs + a * a)` is convertible to `Scalar`.

3 *Returns*: The square root of the sum whose terms are the following:

(3.1) — the square of the absolute value of `init`, and

(3.2) — the squares of the absolute values of the elements of `v`.

[*Note 2*: For `init` equal to zero, this is the Euclidean norm (also called 2-norm) of the vector `v`. — *end note*]

4 *Remarks*: If `Scalar` has higher precision than `InVec::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-vector InVec>
  auto vector_two_norm(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  auto vector_two_norm(ExecutionPolicy&& exec, InVec v);
```

5 *Effects*: Let `a` be *`abs-if-needed`*`(declval<typename InVec::value_type>())`. Let `T` be `decltype(a * a)`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return vector_two_norm(v, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return vector_two_norm(std::forward<ExecutionPolicy>(exec), v, T{});
```

29.9.13.9 Sum of absolute values of vector elements [linalg.algs.blas1.asum]

```
template<in-vector InVec, scalar Scalar>
  Scalar vector_abs_sum(InVec v, Scalar init);
template<class ExecutionPolicy, in-vector InVec, scalar Scalar>
  Scalar vector_abs_sum(ExecutionPolicy&& exec, InVec v, Scalar init);
```

1 [*Note 1*: These functions correspond to the BLAS functions `SASUM`, `DASUM`, `SCASUM`, and `DZASUM`[16]. — *end note*]

2 *Mandates*:

```
decltype(init + abs-if-needed(real-if-needed(declval<typename InVec::value_type>())) +
               abs-if-needed(imag-if-needed(declval<typename InVec::value_type>())))
```

is convertible to `Scalar`.

3 *Returns*: Let `N` be `v.extent(0)`.

(3.1) — `init` if `N` is zero;

(3.2) — otherwise, if `InVec::value_type` is an arithmetic type,

```
GENERALIZED_SUM(plus<>(), init, abs-if-needed(v[0]), ..., abs-if-needed(v[N-1]))
```

(3.3) — otherwise,

```
GENERALIZED_SUM(plus<>(), init,
       abs-if-needed(real-if-needed(v[0])) + abs-if-needed(imag-if-needed(v[0])),
       ...,
       abs-if-needed(real-if-needed(v[N-1])) + abs-if-needed(imag-if-needed(v[N-1])))
```

4 *Remarks*: If `InVec::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InVec::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-vector InVec>
  auto vector_abs_sum(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  auto vector_abs_sum(ExecutionPolicy&& exec, InVec v);
```

5 *Effects*: Let `T` be `typename InVec::value_type`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return vector_abs_sum(v, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return vector_abs_sum(std::forward<ExecutionPolicy>(exec), v, T{});
```

29.9.13.10 Index of maximum absolute value of vector elements [linalg.algs.blas1.iamax]

```
template<in-vector InVec>
  typename InVec::extents_type vector_idx_abs_max(InVec v);
template<class ExecutionPolicy, in-vector InVec>
  typename InVec::extents_type vector_idx_abs_max(ExecutionPolicy&& exec, InVec v);
```

1 [*Note 1*: These functions correspond to the BLAS function `IxAMAX`[16]. — *end note*]

2 Let `T` be

```
decltype(abs-if-needed(real-if-needed(declval<typename InVec::value_type>())) +
         abs-if-needed(imag-if-needed(declval<typename InVec::value_type>())))
```

3 *Mandates*: `declval<T>() < declval<T>()` is a valid expression.

4 *Returns*:

(4.1) — `numeric_limits<typename InVec::size_type>::max()` if `v` has zero elements;

(4.2) — otherwise, the index of the first element of `v` having largest absolute value, if `InVec::value_type` is an arithmetic type;

(4.3) — otherwise, the index of the first element $\mathtt{v}_e$ of `v` for which

```
abs-if-needed(real-if-needed(v_e)) + abs-if-needed(imag-if-needed(v_e))
```

has the largest value.

29.9.13.11 Frobenius norm of a matrix [linalg.algs.blas1.matfrobnorm]

1 [*Note 1*: These functions exist in the BLAS standard[20] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, scalar Scalar>
  Scalar matrix_frob_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, scalar Scalar>
  Scalar matrix_frob_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: `InMat::value_type` and `Scalar` are either a floating-point type, or a specialization of `complex`. Let `a` be *abs-if-needed*`(declval<typename InMat::value_type>())` and let `init_abs` be *abs-if-needed*`(init)`. Then, `decltype(init_abs * init_abs + a * a)` is convertible to `Scalar`.

3 *Returns*: The square root of the sum whose terms are the following:

(3.1) — the square of the absolute value of `init`, and

(3.2) — the squares of the absolute values of the elements of `A`.

[*Note 2*: For `init` equal to zero, this is the Frobenius norm of the matrix `A`. — *end note*]

4 *Remarks*: If `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_frob_norm(InMat A);
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_frob_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `a` be *abs-if-needed*`(declval<typename InMat::value_type>())`. Let `T` be `decltype(a * a)`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_frob_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_frob_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.13.12 One norm of a matrix [linalg.algs.blas1.matonenorm]

1 [*Note 1*: These functions exist in the BLAS standard[20] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, scalar Scalar>
  Scalar matrix_one_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, scalar Scalar>
  Scalar matrix_one_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: `decltype(`*abs-if-needed*`(declval<typename InMat::value_type>()))` is convertible to `Scalar`.

3 *Returns*:

(3.1) — `init` if `A.extent(1)` is zero;

(3.2) — otherwise, the sum of `init` and the one norm of the matrix `A`.

[*Note 2*: The one norm of the matrix `A` is the maximum over all columns of `A`, of the sum of the absolute values of the elements of the column. — *end note*]

4 *Remarks*: If `InMat::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_one_norm(InMat A);
```

```
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_one_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `T` be `decltype(abs-if-needed(declval<typename InMat::value_type>()))`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_one_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_one_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.13.13 Infinity norm of a matrix [linalg.algs.blas1.matinfnorm]

1 [*Note 1*: These functions exist in the BLAS standard[20] but are not part of the reference implementation. — *end note*]

```
template<in-matrix InMat, scalar Scalar>
  Scalar matrix_inf_norm(InMat A, Scalar init);
template<class ExecutionPolicy, in-matrix InMat, scalar Scalar>
  Scalar matrix_inf_norm(ExecutionPolicy&& exec, InMat A, Scalar init);
```

2 *Mandates*: `decltype(abs-if-needed(declval<typename InMat::value_type>()))` is convertible to `Scalar`.

3 *Returns*:

(3.1) — `init` if `A.extent(0)` is zero;

(3.2) — otherwise, the sum of `init` and the infinity norm of the matrix `A`.

[*Note 2*: The infinity norm of the matrix `A` is the maximum over all rows of `A`, of the sum of the absolute values of the elements of the row. — *end note*]

4 *Remarks*: If `InMat::value_type` and `Scalar` are all floating-point types or specializations of `complex`, and if `Scalar` has higher precision than `InMat::value_type`, then intermediate terms in the sum use `Scalar`'s precision or greater.

```
template<in-matrix InMat>
  auto matrix_inf_norm(InMat A);
template<class ExecutionPolicy, in-matrix InMat>
  auto matrix_inf_norm(ExecutionPolicy&& exec, InMat A);
```

5 *Effects*: Let `T` be `decltype(abs-if-needed(declval<typename InMat::value_type>()))`. Then,

(5.1) — the one-parameter overload is equivalent to:

```
return matrix_inf_norm(A, T{});
```

and

(5.2) — the two-parameter overload is equivalent to:

```
return matrix_inf_norm(std::forward<ExecutionPolicy>(exec), A, T{});
```

29.9.14 BLAS 2 algorithms [linalg.algs.blas2]

29.9.14.1 General matrix-vector product [linalg.algs.blas2.gemv]

1 [*Note 1*: These functions correspond to the BLAS function `xGEMV`. — *end note*]

2 The following elements apply to all functions in 29.9.14.1.

3 *Mandates*:

(3.1) — *possibly-multipliable*`<decltype(A), decltype(x), decltype(y)>()` is `true`, and

(3.2) — *possibly-addable*`<decltype(y), decltype(y), decltype(z)>()` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — *multipliable*`(A,x,y)` is `true`, and

(4.2) — *addable*`(y,y,z)` is `true` for those overloads that take a `z` parameter.

5 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `x.extent(0)`).

```
template<in-matrix InMat, in-vector InVec, out-vector OutVec>
  void matrix_vector_product(InMat A, InVec x, OutVec y);
template<class ExecutionPolicy, in-matrix InMat, in-vector InVec, out-vector OutVec>
  void matrix_vector_product(ExecutionPolicy&& exec, InMat A, InVec x, OutVec y);
```

6 These functions perform an overwriting matrix-vector product.

7 *Effects*: Computes $y = Ax$.

[*Example 1*:

```
constexpr size_t num_rows = 5;
constexpr size_t num_cols = 6;

// y = 3.0 * A * x
void scaled_matvec_1(mdspan<double, extents<size_t, num_rows, num_cols>> A,
  mdspan<double, extents<size_t, num_cols>> x, mdspan<double, extents<size_t, num_rows>> y) {
  matrix_vector_product(scaled(3.0, A), x, y);
}

// z = 7.0 times the transpose of A, times y
void scaled_transposed_matvec(mdspan<double, extents<size_t, num_rows, num_cols>> A,
  mdspan<double, extents<size_t, num_rows>> y, mdspan<double, extents<size_t, num_cols>> z) {
  matrix_vector_product(scaled(7.0, transposed(A)), y, z);
}
```

— *end example*]

```
template<in-matrix InMat, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void matrix_vector_product(InMat A, InVec1 x, InVec2 y, OutVec z);
template<class ExecutionPolicy,
         in-matrix InMat, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void matrix_vector_product(ExecutionPolicy&& exec,
                             InMat A, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating matrix-vector product.

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: `z` may alias `y`.

[*Example 2*:

```
// y = 3.0 * A * x + 2.0 * y
void scaled_matvec_2(mdspan<double, extents<size_t, num_rows, num_cols>> A,
  mdspan<double, extents<size_t, num_cols>> x, mdspan<double, extents<size_t, num_rows>> y) {
  matrix_vector_product(scaled(3.0, A), x, scaled(2.0, y), y);
}
```

— *end example*]

29.9.14.2 Symmetric matrix-vector product [linalg.algs.blas2.symv]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYMV` and `xSPMV`[17]. — *end note*]

2 The following elements apply to all functions in 29.9.14.2.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *`possibly-multipliable`*`<decltype(A), decltype(x), decltype(y)>()` is `true`; and

(3.4) — *`possibly-addable`*`<decltype(y), decltype(y), decltype(z)>()` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — *`multipliable`*`(A,x,y)` is `true`, and

(4.3) — *addable*(y,y,z) is true for those overloads that take a z parameter.

5 *Complexity*: $\mathcal{O}$(A.extent(0) × x.extent(0)).

```
template<in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void symmetric_matrix_vector_product(InMat A, Triangle t, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void symmetric_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec x, OutVec y);
```

6 These functions perform an overwriting symmetric matrix-vector product, taking into account the Triangle parameter that applies to the symmetric matrix A (29.9.3).

7 *Effects*: Computes $y = Ax$.

```
template<in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void symmetric_matrix_vector_product(InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void symmetric_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating symmetric matrix-vector product, taking into account the Triangle parameter that applies to the symmetric matrix A (29.9.3).

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: z may alias y.

29.9.14.3 Hermitian matrix-vector product [linalg.algs.blas2.hemv]

1 [*Note 1*: These functions correspond to the BLAS functions xHEMV and xHPMV[17]. — *end note*]

2 The following elements apply to all functions in 29.9.14.3.

3 *Mandates*:

(3.1) — If InMat has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(3.2) — *compatible-static-extents*<decltype(A), decltype(A)>(0, 1) is true;

(3.3) — *possibly-multipliable*<decltype(A), decltype(x), decltype(y)>() is true; and

(3.4) — *possibly-addable*<decltype(y), decltype(y), decltype(z)>() is true for those overloads that take a z parameter.

4 *Preconditions*:

(4.1) — A.extent(0) equals A.extent(1),

(4.2) — *multipliable*(A, x, y) is true, and

(4.3) — *addable*(y, y, z) is true for those overloads that take a z parameter.

5 *Complexity*: $\mathcal{O}$(A.extent(0) × x.extent(0)).

```
template<in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void hermitian_matrix_vector_product(InMat A, Triangle t, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec, out-vector OutVec>
  void hermitian_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec x, OutVec y);
```

6 These functions perform an overwriting Hermitian matrix-vector product, taking into account the Triangle parameter that applies to the Hermitian matrix A (29.9.3).

7 *Effects*: Computes $y = Ax$.

```
template<in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void hermitian_matrix_vector_product(InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void hermitian_matrix_vector_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, InVec1 x, InVec2 y, OutVec z);
```

8 These functions perform an updating Hermitian matrix-vector product, taking into account the `Triangle` parameter that applies to the Hermitian matrix `A` (29.9.3).

9 *Effects*: Computes $z = y + Ax$.

10 *Remarks*: `z` may alias `y`.

29.9.14.4 Triangular matrix-vector product [linalg.algs.blas2.trmv]

1 [*Note 1*: These functions correspond to the BLAS functions `xTRMV` and `xTPMV`[17]. — *end note*]

2 The following elements apply to all functions in 29.9.14.4.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *compatible-static-extents*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *compatible-static-extents*`<decltype(A), decltype(y)>(0, 0)` is `true`;

(3.4) — *compatible-static-extents*`<decltype(A), decltype(x)>(0, 0)` is `true` for those overloads that take an `x` parameter; and

(3.5) — *compatible-static-extents*`<decltype(A), decltype(z)>(0, 0)` is `true` for those overloads that take a `z` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `A.extent(0)` equals `y.extent(0)`,

(4.3) — `A.extent(0)` equals `x.extent(0)` for those overloads that take an `x` parameter, and

(4.4) — `A.extent(0)` equals `z.extent(0)` for those overloads that take a `z` parameter.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, in-vector InVec,
         out-vector OutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d, InVec x, OutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, in-vector InVec,
         out-vector OutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d, InVec x, OutVec y);
```

5 These functions perform an overwriting triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

6 *Effects*: Computes $y = Ax$.

7 *Complexity*: $\mathcal{O}$(`A.extent(0)` × `x.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d, InOutVec y);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d, InOutVec y);
```

8 These functions perform an in-place triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: Performing this operation in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

9 *Effects*: Computes a vector y' such that $y' = Ay$, and assigns each element of y' to the corresponding element of y.

10 *Complexity*: $\mathcal{O}$(`A.extent(0)` × `y.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void triangular_matrix_vector_product(InMat A, Triangle t, DiagonalStorage d,
                                        InVec1 x, InVec2 y, OutVec z);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec1, in-vector InVec2, out-vector OutVec>
  void triangular_matrix_vector_product(ExecutionPolicy&& exec,
                                        InMat A, Triangle t, DiagonalStorage d,
                                        InVec1 x, InVec2 y, OutVec z);
```

11 These functions perform an updating triangular matrix-vector product, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

12 *Effects*: Computes $z = y + Ax$.

13 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `x.extent(0)`).

14 *Remarks*: `z` may alias `y`.

29.9.14.5 Solve a triangular linear system [linalg.algs.blas2.trsv]

1 [*Note 1*: These functions correspond to the BLAS functions `xTRSV` and `xTPSV`[17]. — *end note*]

2 The following elements apply to all functions in 29.9.14.5.

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *compatible-static-extents*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(3.3) — *compatible-static-extents*`<decltype(A), decltype(b)>(0, 0)` is `true`; and

(3.4) — *compatible-static-extents*`<decltype(A), decltype(x)>(0, 0)` is `true` for those overloads that take an `x` parameter.

4 *Preconditions*:

(4.1) — `A.extent(0)` equals `A.extent(1)`,

(4.2) — `A.extent(0)` equals `b.extent(0)`, and

(4.3) — `A.extent(0)` equals `x.extent(0)` for those overloads that take an `x` parameter.

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d,
                                      InVec b, OutVec x, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d,
                                      InVec b, OutVec x, BinaryDivideOp divide);
```

5 These functions perform a triangular solve, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

6 *Effects*: Computes a vector x' such that $b = Ax'$, and assigns each element of x' to the corresponding element of x. If no such x' exists, then the elements of `x` are valid but unspecified.

7 *Complexity*: $\mathcal{O}$(`A.extent(1)` $\times$ `b.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d, InVec b, OutVec x);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(A, t, d, b, x, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         in-vector InVec, out-vector OutVec>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InVec b, OutVec x);
```

9 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(std::forward<ExecutionPolicy>(exec),
                                      A, t, d, b, x, divides<void>{});
```

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-vector InOutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d,
                                      InOutVec b, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-vector InOutVec, class BinaryDivideOp>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d,
                                      InOutVec b, BinaryDivideOp divide);
```

10 These functions perform an in-place triangular solve, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

11 *Effects*: Computes a vector x' such that $b = Ax'$, and assigns each element of x' to the corresponding element of b. If no such x' exists, then the elements of `b` are valid but unspecified.

12 *Complexity*: $\mathcal{O}$(`A.extent(1)` $\times$ `b.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_solve(InMat A, Triangle t, DiagonalStorage d, InOutVec b);
```

13 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(A, t, d, b, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-vector InOutVec>
  void triangular_matrix_vector_solve(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InOutVec b);
```

14 *Effects*: Equivalent to:

```
triangular_matrix_vector_solve(std::forward<ExecutionPolicy>(exec),
                                      A, t, d, b, divides<void>{});
```

29.9.14.6 Rank-1 (outer product) update of a matrix [linalg.algs.blas2.rank1]

1 The following elements apply to all functions in 29.9.14.6.

2 *Mandates*:

(2.1) — *possibly-multipliable*`<OutMat, InVec2, InVec1>()` is `true`, and

(2.2) — *possibly-addable*`<OutMat, InMat, OutMat>()` is `true` for those overloads with an `E` parameter.

3 *Preconditions*:

(3.1) — *multipliable*`(A, y, x)` is `true`, and

(3.2) — *addable*`(A, E, A)` is `true` for those overloads with an `E` parameter.

4 *Complexity*: $\mathcal{O}$(`x.extent(0)` $\times$ `y.extent(0)`).

```
template<in-vector InVec1, in-vector InVec2, out-matrix OutMat>
  void matrix_rank_1_update(InVec1 x, InVec2 y, OutMat A);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, out-matrix OutMat>
  void matrix_rank_1_update(ExecutionPolicy&& exec, InVec1 x, InVec2 y, OutMat A);
```

5 These functions perform an overwriting nonsymmetric nonconjugated rank-1 update.

[*Note 1*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERU` (for complex element types)[17]. — *end note*]

6 *Effects*: Computes $A = xy^T$.

```
template<in-vector InVec1, in-vector InVec2, in-matrix InMat, out-matrix OutMat>
  void matrix_rank_1_update(InVec1 x, InVec2 y, InMat E, OutMat A);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, in-matrix InMat,
         out-matrix OutMat>
  void matrix_rank_1_update(ExecutionPolicy&& exec, InVec1 x, InVec2 y, InMat E, OutMat A);
```

7 These functions perform an updating nonsymmetric nonconjugated rank-1 update.

[*Note 2*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERU` (for complex element types)[17]. — *end note*]

8 *Effects*: Computes $A = E + xy^T$.

9 *Remarks*: `A` may alias `E`.

```
template<in-vector InVec1, in-vector InVec2, out-matrix OutMat>
  void matrix_rank_1_update_c(InVec1 x, InVec2 y, OutMat A);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, out-matrix OutMat>
  void matrix_rank_1_update_c(ExecutionPolicy&& exec, InVec1 x, InVec2 y, OutMat A);
```

10 These functions perform an overwriting nonsymmetric conjugated rank-1 update.

[*Note 3*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERC` (for complex element types)[17]. — *end note*]

11 *Effects*:

(11.1) — For the overloads without an `ExecutionPolicy` argument, equivalent to:

```
matrix_rank_1_update(x, conjugated(y), A);
```

(11.2) — otherwise, equivalent to:

```
matrix_rank_1_update(std::forward<ExecutionPolicy>(exec), x, conjugated(y), A);
```

```
template<in-vector InVec1, in-vector InVec2, in-matrix InMat, out-matrix OutMat>
  void matrix_rank_1_update_c(InVec1 x, InVec2 y, InMat E, OutMat A);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, in-matrix InMat,
         out-matrix OutMat>
  void matrix_rank_1_update_c(ExecutionPolicy&& exec, InVec1 x, InVec2 y, InMat E, OutMat A);
```

12 These functions perform an updating nonsymmetric conjugated rank-1 update.

[*Note 4*: These functions correspond to the BLAS functions `xGER` (for real element types) and `xGERC` (for complex element types)[17]. — *end note*]

13 *Effects*:

(13.1) — For the overloads without an `ExecutionPolicy` argument, equivalent to:

```
matrix_rank_1_update(x, conjugated(y), E, A);
```

(13.2) — otherwise, equivalent to:

```
matrix_rank_1_update(std::forward<ExecutionPolicy>(exec), x, conjugated(y), E, A);
```

29.9.14.7 Symmetric or Hermitian Rank-1 (outer product) update of a matrix [linalg.algs.blas2.symherrank1]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYR`, `xSPR`, `xHER`, and `xHPR`[17]. They have overloads taking a scaling factor `alpha`, because it would be impossible to express the update $A = A - xx^T$ in noncomplex arithmetic otherwise. — *end note*]

2 The following elements apply to all functions in 29.9.14.7.

3 For any function `F` in this subclause with a parameter named `t`, an `InMat` template parameter, and a function parameter `InMat E`, `t` applies to accesses done through the parameter `E`. `F` only accesses the triangle of `E` specified by `t`. For accesses of diagonal elements `E[i, i]`, `F` only uses the value *`real-if-needed`*`(E[i, i])` if the name of `F` starts with `hermitian`. For accesses `E[i, j]` outside the triangle specified by `t`, `F` only uses the value

(3.1) — *`conj-if-needed`*`(E[j, i])` if the name of `F` starts with `hermitian`, or

(3.2) — `E[j, i]` if the name of `F` starts with `symmetric`.

4 *Mandates*:

(4.1) — If `OutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(4.2) — *`compatible-static-extents`*`<decltype(A), decltype(A)>(0, 1)` is `true`;

(4.3) — *`compatible-static-extents`*`<decltype(A), decltype(x)>(0, 0)` is `true`; and

(4.4) — *`possibly-addable`*`<decltype(A), decltype(E), decltype(A)>()` is `true` for those overloads with an `E` parameter.

5 *Preconditions*:

(5.1) — `A.extent(0)` equals `A.extent(1)`,

(5.2) — `A.extent(0)` equals `x.extent(0)`, and

(5.3) — *`addable`*`(A, E, A)` is `true` for those overloads with an `E` parameter.

6 *Complexity*: $\mathcal{O}$(`x.extent(0)` $\times$ `x.extent(0)`).

```
template<scalar Scalar, in-vector InVec, possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_1_update(Scalar alpha, InVec x, OutMat A, Triangle t);
template<class ExecutionPolicy,
         scalar Scalar, in-vector InVec, possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, OutMat A, Triangle t);
```

7 These functions perform an overwriting symmetric rank-1 update of the symmetric matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

8 *Effects*: Computes a matrix $A = \alpha x x^T$, where the scalar α is `alpha`.

```
template<scalar Scalar, in-vector InVec, in-matrix InMat, possibly-packed-out-matrix OutMat,
         class Triangle>
  void symmetric_matrix_rank_1_update(Scalar alpha, InVec x, InMat E, OutMat A, Triangle t);
template<class ExecutionPolicy, scalar Scalar, in-vector InVec, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, InMat E, OutMat A, Triangle t);
```

9 These functions perform an updating symmetric rank-1 update of the symmetric matrix `A` using the symmetric matrix `E`, taking into account the `Triangle` parameter that applies to `A` and `E` (29.9.3).

10 *Effects*: Computes $A = E + \alpha x x^T$, where the scalar α is `alpha`.

11 *Remarks*: `A` may alias `E`.

```
template<scalar Scalar, in-vector InVec, possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_1_update(Scalar alpha, InVec x, OutMat A, Triangle t);
template<class ExecutionPolicy,
         scalar Scalar, in-vector InVec, possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, OutMat A, Triangle t);
```

12 These functions perform an overwriting Hermitian rank-1 update of the Hermitian matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

13 *Effects*: Computes $A = \alpha x x^H$, where the scalar α is *`real-if-needed`*`(alpha)`.

```
template<scalar Scalar, in-vector InVec, in-matrix InMat, possibly-packed-out-matrix OutMat,
         class Triangle>
  void hermitian_matrix_rank_1_update(Scalar alpha, InVec x, InMat E, OutMat A, Triangle t);
template<class ExecutionPolicy,
         scalar Scalar, in-vector InVec, in-matrix InMat, possibly-packed-out-matrix OutMat,
         class Triangle>
  void hermitian_matrix_rank_1_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InVec x, InMat E, OutMat A, Triangle t);
```

14 These functions perform an updating Hermitian rank-1 update of the Hermitian matrix `A` using the Hermitian matrix `E`, taking into account the `Triangle` parameter that applies to `A` and `E` (29.9.3).

©ISO/IEC

15 *Effects*: Computes $A = E + \alpha x x^H$, where the scalar α is *real-if-needed*(alpha).

16 *Remarks*: A may alias E.

29.9.14.8 Symmetric and Hermitian rank-2 matrix updates [linalg.algs.blas2.rank2]

1 [*Note 1*: These functions correspond to the BLAS functions xSYR2, xSPR2, xHER2 and xHPR2[17]. — *end note*]

2 The following elements apply to all functions in 29.9.14.8.

3 For any function F in this subclause with a parameter named t, an InMat template parameter, and a function parameter InMat E, t applies to accesses done through the parameter E. F only accesses the triangle of E specified by t. For accesses of diagonal elements E[i, i], F only uses the value *real-if-needed*(E[i, i]) if the name of F starts with hermitian. For accesses E[i, j] outside the triangle specified by t, F only uses the value

(3.1) — *conj-if-needed*(E[j, i]) if the name of F starts with hermitian, or

(3.2) — E[j, i] if the name of F starts with symmetric.

4 *Mandates*:

(4.1) — If OutMat has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(4.2) — If the function has an InMat template parameter and InMat has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(4.3) — *compatible-static-extents*<decltype(A), decltype(A)>(0, 1) is true;

(4.4) — *possibly-multipliable*<decltype(A), decltype(x), decltype(y)>() is true; and

(4.5) — *possibly-addable*<decltype(A), decltype(E), decltype(A)>() is true for those overloads with an E parameter.

5 *Preconditions*:

(5.1) — A.extent(0) equals A.extent(1),

(5.2) — *multipliable*(A, x, y) is true, and

(5.3) — *addable*(A, E, A) is true for those overloads with an E parameter.

6 *Complexity*: $\mathcal{O}$(x.extent(0) $\times$ y.extent(0)).

```
template<in-vector InVec1, in-vector InVec2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2_update(InVec1 x, InVec2 y, OutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, OutMat A, Triangle t);
```

7 These functions perform an overwriting symmetric rank-2 update of the symmetric matrix A, taking into account the Triangle parameter that applies to A (29.9.3).

8 *Effects*: Computes $A = xy^T + yx^T$.

```
template<in-vector InVec1, in-vector InVec2, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2_update(InVec1 x, InVec2 y, InMat E, OutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, InMat E, OutMat A, Triangle t);
```

9 These functions perform an updating symmetric rank-2 update of the symmetric matrix A using the symmetric matrix E, taking into account the Triangle parameter that applies to A and E (29.9.3).

10 *Effects*: Computes $A = E + xy^T + yx^T$.

11 *Remarks*: A may alias E.

```
template<in-vector InVec1, in-vector InVec2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2_update(InVec1 x, InVec2 y, OutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, OutMat A, Triangle t);
```

12 These functions perform an overwriting Hermitian rank-2 update of the Hermitian matrix `A`, taking into account the `Triangle` parameter that applies to `A` (29.9.3).

13 *Effects*: Computes $A = xy^H + yx^H$.

```
template<in-vector InVec1, in-vector InVec2, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2_update(InVec1 x, InVec2 y, InMat E, OutMat A, Triangle t);
template<class ExecutionPolicy, in-vector InVec1, in-vector InVec2, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2_update(ExecutionPolicy&& exec,
                                      InVec1 x, InVec2 y, InMat E, OutMat A, Triangle t);
```

14 These functions perform an updating Hermitian rank-2 update of the Hermitian matrix `A` using the Hermitian matrix `E`, taking into account the `Triangle` parameter that applies to `A` and `E` (29.9.3).

15 *Effects*: Computes $A = E + xy^H + yx^H$.

16 *Remarks*: `A` may alias `E`.

29.9.15 BLAS 3 algorithms [linalg.algs.blas3]

29.9.15.1 General matrix-matrix product [linalg.algs.blas3.gemm]

1 [*Note 1*: These functions correspond to the BLAS function `xGEMM`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.15.1 in addition to function-specific elements.

3 *Mandates*: *possibly-multipliable*`<decltype(A), decltype(B), decltype(C)>()` is `true`.

4 *Preconditions*: *multipliable*`(A, B, C)` is `true`.

5 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `A.extent(1)` $\times$ `B.extent(1)`).

```
template<in-matrix InMat1, in-matrix InMat2, out-matrix OutMat>
  void matrix_product(InMat1 A, InMat2 B, OutMat C);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2, out-matrix OutMat>
  void matrix_product(ExecutionPolicy&& exec, InMat1 A, InMat2 B, OutMat C);
```

6 *Effects*: Computes $C = AB$.

```
template<in-matrix InMat1, in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void matrix_product(InMat1 A, InMat2 B, InMat3 E, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, in-matrix InMat3, out-matrix OutMat>
  void matrix_product(ExecutionPolicy&& exec, InMat1 A, InMat2 B, InMat3 E, OutMat C);
```

7 *Mandates*: *possibly-addable*`<InMat3, InMat3, OutMat>()` is `true`.

8 *Preconditions*: *addable*`(E, E, C)` is `true`.

9 *Effects*: Computes $C = E + AB$.

10 *Remarks*: `C` may alias `E`.

29.9.15.2 Symmetric, Hermitian, and triangular matrix-matrix product [linalg.algs.blas3.xxmm]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYMM`, `xHEMM`, and `xTRMM`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.15.2 in addition to function-specific elements.

3 *Mandates*:

(3.1) — *possibly-multipliable*`<decltype(A), decltype(B), decltype(C)>()` is `true`, and

(3.2) — *possibly-addable*`<decltype(E), decltype(E), decltype(C)>()` is `true` for those overloads that take an `E` parameter.

4 *Preconditions*:

(4.1) — *multipliable*(A, B, C) is true, and

(4.2) — *addable*(E, E, C) is true for those overloads that take an E parameter.

5 *Complexity*: $\mathcal{O}$(A.extent(0) × A.extent(1) × B.extent(1)).

```
template<in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, Triangle t, InMat2 B, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec, InMat1 A, Triangle t, InMat2 B, OutMat C);

template<in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, Triangle t, InMat2 B, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, in-matrix InMat2, out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec, InMat1 A, Triangle t, InMat2 B, OutMat C);

template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, OutMat C);
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_product(ExecutionPolicy&& exec,
                                 InMat1 A, Triangle t, DiagonalStorage d, InMat2 B, OutMat C);
```

6 These functions perform a matrix-matrix multiply, taking into account the Triangle and DiagonalStorage (if applicable) parameters that apply to the symmetric, Hermitian, or triangular (respectively) matrix A (29.9.3).

7 *Mandates*:

(7.1) — If InMat1 has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument; and

(7.2) — *compatible-static-extents*<InMat1, InMat1>(0, 1) is true.

8 *Preconditions*: A.extent(0) == A.extent(1) is true.

9 *Effects*: Computes $C = AB$.

```
template<in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void symmetric_matrix_product(InMat1 A, InMat2 B, Triangle t, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void symmetric_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void hermitian_matrix_product(InMat1 A, InMat2 B, Triangle t, OutMat C);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2, class Triangle, out-matrix OutMat>
  void hermitian_matrix_product(ExecutionPolicy&& exec,
                                InMat1 A, InMat2 B, Triangle t, OutMat C);

template<in-matrix InMat1, in-matrix InMat2, class Triangle, class DiagonalStorage,
         out-matrix OutMat>
  void triangular_matrix_product(InMat1 A, InMat2 B, Triangle t, DiagonalStorage d, OutMat C);

21 *Preconditions*: `B.extent(0) == B.extent(1)` is `true`.

22 *Effects*: Computes $C = E + AB$.

23 *Remarks*: `C` may alias `E`.

29.9.15.3 In-place triangular matrix-matrix product [linalg.algs.blas3.trmm]

1 These functions perform an in-place matrix-matrix multiply, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 1*: These functions correspond to the BLAS function `xTRMM`[18]. — *end note*]

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_left_product(InMat A, Triangle t, DiagonalStorage d, InOutMat C);
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_left_product(ExecutionPolicy&& exec,
                                      InMat A, Triangle t, DiagonalStorage d, InOutMat C);
```

2 *Mandates*:

(2.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(2.2) — *`possibly-multipliable`*`<InMat, InOutMat, InOutMat>()` is `true`; and

(2.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

3 *Preconditions*:

(3.1) — *`multipliable`*`(A, C, C)` is `true`, and

(3.2) — `A.extent(0) == A.extent(1)` is `true`.

4 *Effects*: Computes a matrix C' such that $C' = AC$ and assigns each element of C' to the corresponding element of C.

5 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `A.extent(1)` $\times$ `C.extent(0)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_right_product(InMat A, Triangle t, DiagonalStorage d, InOutMat C);
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_right_product(ExecutionPolicy&& exec,
                                       InMat A, Triangle t, DiagonalStorage d, InOutMat C);
```

6 *Mandates*:

(6.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(6.2) — *possibly-multipliable*`<InOutMat, InMat, InOutMat>()` is `true`; and

(6.3) — *compatible-static-extents*`<InMat, InMat>(0, 1)` is `true`.

7 *Preconditions*:

(7.1) — *multipliable*`(C, A, C)` is `true`, and

(7.2) — `A.extent(0) == A.extent(1)` is `true`.

8 *Effects*: Computes a matrix C' such that $C' = CA$ and assigns each element of C' to the corresponding element of C.

9 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `A.extent(1)` $\times$ `C.extent(0)`).

29.9.15.4 Rank-k update of a symmetric or Hermitian matrix [linalg.algs.blas3.rankk]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYRK` and `xHERK`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.15.4.

3 For any function `F` in this subclause with a parameter named `t`, an `InMat2` template parameter, and a function parameter `InMat2 E`, `t` applies to accesses done through the parameter `E`. `F` only accesses the triangle of `E` specified by `t`. For accesses of diagonal elements `E[i, i]`, `F` only uses the value *real-if-needed*`(E[i, i])` if the name of `F` starts with `hermitian`. For accesses `E[i, j]` outside the triangle specified by `t`, `F` only uses the value

(3.1) — *conj-if-needed*`(E[j, i])` if the name of `F` starts with `hermitian`, or

(3.2) — `E[j, i]` if the name of `F` starts with `symmetric`.

4 *Mandates*:

(4.1) — If `OutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(4.2) — If the function has an `InMat2` template parameter and if `InMat2` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(4.3) — *possibly-multipliable*`<decltype(A), decltype(transposed(A)), decltype(C)>()` is `true`; and

(4.4) — *possibly-addable*`<decltype(C), decltype(E), decltype(C)>()` is `true` for those overloads with an `E` parameter.

5 *Preconditions*:

(5.1) — *multipliable*`(A, transposed(A), C)` is `true`; and

[*Note 2*: This implies that `C` is square. — *end note*]

(5.2) — *addable*`(C, E, C)` is `true` for those overloads with an `E` parameter.

6 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `A.extent(1)` $\times$ `A.extent(0)`).

7 *Remarks*: `C` may alias `E` for those overloads with an `E` parameter.

```
template<scalar Scalar, in-matrix InMat, possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_k_update(Scalar alpha, InMat A, OutMat C, Triangle t);
template<class ExecutionPolicy, scalar Scalar,
         in-matrix InMat, possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_k_update(ExecutionPolicy&& exec,
                                      Scalar alpha, InMat A, OutMat C, Triangle t);
```

8 *Effects*: Computes $C = \alpha AA^T$, where the scalar α is `alpha`.

```
template<scalar Scalar, in-matrix InMat, possibly-packed-out-matrix OutMat,
         class Triangle>
void hermitian_matrix_rank_k_update(Scalar alpha, InMat A, OutMat C, Triangle t);
template<class ExecutionPolicy, scalar Scalar, in-matrix InMat,
         possibly-packed-out-matrix OutMat, class Triangle>
void hermitian_matrix_rank_k_update(ExecutionPolicy&& exec, Scalar alpha, InMat A,
                                    OutMat C, Triangle t);
```

9 *Effects*: Computes $C = \alpha AA^H$, where the scalar α is *real-if-needed*(alpha).

```
template<scalar Scalar, in-matrix InMat1, in-matrix InMat2, possibly-packed-out-matrix OutMat,
         class Triangle>
void symmetric_matrix_rank_k_update(Scalar alpha, InMat1 A, InMat2 E, OutMat C, Triangle t);
template<class ExecutionPolicy, scalar Scalar, in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
void symmetric_matrix_rank_k_update(ExecutionPolicy&& exec, Scalar alpha, InMat1 A, InMat2 E,
                                    OutMat C, Triangle t);
```

10 *Effects*: Computes $C = E + \alpha AA^T$, where the scalar α is `alpha`.

```
template<scalar Scalar, in-matrix InMat1, in-matrix InMat2, possibly-packed-out-matrix OutMat,
         class Triangle>
void hermitian_matrix_rank_k_update(Scalar alpha, InMat1 A, InMat2 E, OutMat C, Triangle t);
template<class ExecutionPolicy, scalar Scalar, in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
void hermitian_matrix_rank_k_update(ExecutionPolicy&& exec, Scalar alpha, InMat1 A, InMat2 E,
                                    OutMat C, Triangle t);
```

11 *Effects*: Computes $C = E + \alpha AA^H$, where the scalar α is *real-if-needed*(alpha).

29.9.15.5 Rank-2k update of a symmetric or Hermitian matrix [linalg.algs.blas3.rank2k]

1 [*Note 1*: These functions correspond to the BLAS functions `xSYR2K` and `xHER2K`[18]. — *end note*]

2 The following elements apply to all functions in 29.9.15.5.

3 For any function `F` in this subclause with a parameter named `t`, an `InMat3` template parameter, and a function parameter `InMat3 E`, `t` applies to accesses done through the parameter `E`. `F` only accesses the triangle of `E` specified by `t`. For accesses of diagonal elements `E[i, i]`, `F` only uses the value *real-if-needed*(`E[i, i]`) if the name of `F` starts with `hermitian`. For accesses `E[i, j]` outside the triangle specified by `t`, `F` only uses the value

(3.1) — *conj-if-needed*(`E[j, i]`) if the name of `F` starts with `hermitian`, or

(3.2) — `E[j, i]` if the name of `F` starts with `symmetric`.

4 *Mandates*:

(4.1) — If `OutMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(4.2) — If the function has an `InMat3` template parameter and if `InMat3` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(4.3) — *possibly-multipliable*`<decltype(A), decltype(transposed(B)), decltype(C)>()` is `true`;

(4.4) — *possibly-multipliable*`<decltype(B), decltype(transposed(A)), decltype(C)>()` is `true`; and

(4.5) — *possibly-addable*`<decltype(C), decltype(E), decltype(C)>()` is `true` for those overloads with an `E` parameter.

5 *Preconditions*:

(5.1) — *multipliable*(`A, transposed(B), C`) is `true`,

(5.2) — *multipliable*(`B, transposed(A), C`) is `true`, and

[*Note 2*: This and the previous imply that `C` is square. — *end note*]

(5.3) — *addable*(`C, E, C`) is `true` for those overloads with an `E` parameter.

6 *Complexity*: $\mathcal{O}$(`A.extent(0)` × `A.extent(1)` × `B.extent(0)`).

7 *Remarks*: `C` may alias `E` for those overloads with an `E` parameter.

```
template<in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2k_update(InMat1 A, InMat2 B, OutMat C, Triangle t);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void symmetric_matrix_rank_2k_update(ExecutionPolicy&& exec,
                                       InMat1 A, InMat2 B, OutMat C, Triangle t);
```

8 *Effects*: Computes $C = AB^T + BA^T$.

```
template<in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2k_update(InMat1 A, InMat2 B, OutMat C, Triangle t);
template<class ExecutionPolicy,
         in-matrix InMat1, in-matrix InMat2,
         possibly-packed-out-matrix OutMat, class Triangle>
  void hermitian_matrix_rank_2k_update(ExecutionPolicy&& exec,
                                       InMat1 A, InMat2 B, OutMat C, Triangle t);
```

9 *Effects*: Computes $C = AB^H + BA^H$.

```
template<in-matrix InMat1, in-matrix InMat2, in-matrix InMat3,
         possibly-packed-out-matrix OutMat, class Triangle>
void symmetric_matrix_rank_2k_update(InMat1 A, InMat2 B, InMat3 E, OutMat C, Triangle t);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2, in-matrix InMat3,
         possibly-packed-out-matrix OutMat, class Triangle>
void symmetric_matrix_rank_2k_update(ExecutionPolicy&& exec,
                                     InMat1 A, InMat2 B, InMat3 E, OutMat C, Triangle t);
```

10 *Effects*: Computes $C = E + AB^T + BA^T$.

```
template<in-matrix InMat1, in-matrix InMat2, in-matrix InMat3, possibly-packed-out-matrix OutMat,
         class Triangle>
void hermitian_matrix_rank_2k_update(InMat1 A, InMat2 B, InMat3 E, OutMat C, Triangle t);
template<class ExecutionPolicy, in-matrix InMat1, in-matrix InMat2, in-matrix InMat3,
         possibly-packed-out-matrix OutMat,
         class Triangle>
void hermitian_matrix_rank_2k_update(ExecutionPolicy&& exec, InMat1 A, InMat2 B, InMat3 E,
                                     OutMat C, Triangle t);
```

11 *Effects*: Computes $C = E + AB^H + BA^H$.

29.9.15.6 Solve multiple triangular linear systems [linalg.algs.blas3.trsm]

1 [*Note 1*: These functions correspond to the BLAS function `xTRSM`[18]. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X, BinaryDivideOp divide);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X, BinaryDivideOp divide);
```

2 These functions perform multiple matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

3 *Mandates*:

(3.1) — If `InMat1` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`possibly-multipliable`*`<InMat1, OutMat, InMat2>()` is `true`; and

(3.3) — *`compatible-static-extents`*`<InMat1, InMat1>(0, 1)` is `true`.

4 *Preconditions*:

(4.1) — *multipliable*(A, X, B) is true, and

(4.2) — A.extent(0) == A.extent(1) is true.

5 *Effects*: Computes X' such that $AX' = B$, and assigns each element of X' to the corresponding element of X. If no such X' exists, then the elements of X are valid but unspecified.

6 *Complexity*: $\mathcal{O}$(A.extent(0) $\times$ B.extent(1) $\times$ B.extent(1)).

7 [*Note 2*: Since the triangular matrix is on the left, the desired divide implementation in the case of noncommutative multiplication is mathematically equivalent to $y^{-1}x$, where x is the first argument and y is the second argument, and y^{-1} denotes the multiplicative inverse of y. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_left_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(A, t, d, B, X, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat1 A, Triangle t, DiagonalStorage d,
                                           InMat2 B, OutMat X);
```

9 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(std::forward<ExecutionPolicy>(exec),
                                    A, t, d, B, X, divides<void>{});
```

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X, BinaryDivideOp divide);
template<class ExecutionPolicy,
         in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X, BinaryDivideOp divide);
```

10 These functions perform multiple matrix solves, taking into account the Triangle and DiagonalStorage parameters that apply to the triangular matrix A (29.9.3).

11 *Mandates*:

(11.1) — If InMat1 has layout_blas_packed layout, then the layout's Triangle template argument has the same type as the function's Triangle template argument;

(11.2) — *possibly-multipliable*<OutMat, InMat1, InMat2>() is true; and

(11.3) — *compatible-static-extents*<InMat1, InMat1>(0,1) is true.

12 *Preconditions*:

(12.1) — *multipliable*(X, A, B) is true, and

(12.2) — A.extent(0) == A.extent(1) is true.

13 *Effects*: Computes X' such that $X'A = B$, and assigns each element of X' to the corresponding element of X. If no such X' exists, then the elements of X are valid but unspecified.

14 *Complexity*: $O($ B.extent(0) $\cdot$ B.extent(1) $\cdot$ A.extent(1) $)$

[*Note 3*: Since the triangular matrix is on the right, the desired divide implementation in the case of noncommutative multiplication is mathematically equivalent to xy^{-1}, where x is the first argument and y is the second argument, and y^{-1} denotes the multiplicative inverse of y. — *end note*]

```
template<in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_right_solve(InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X);
```

15 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(A, t, d, B, X, divides<void>{});
```

```
template<class ExecutionPolicy, in-matrix InMat1, class Triangle, class DiagonalStorage,
         in-matrix InMat2, out-matrix OutMat>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat1 A, Triangle t, DiagonalStorage d,
                                            InMat2 B, OutMat X);
```

16 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(std::forward<ExecutionPolicy>(exec),
                                     A, t, d, B, X, divides<void>{});
```

29.9.15.7 Solve multiple triangular linear systems in-place [linalg.algs.blas3.inplacetrsm]

1 [*Note 1*: These functions correspond to the BLAS function `xTRSM`[18]. — *end note*]

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B, BinaryDivideOp divide);
```

2 These functions perform multiple in-place matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 2*: This algorithm makes it possible to compute factorizations like Cholesky and LU in place. Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

3 *Mandates*:

(3.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(3.2) — *`possibly-multipliable`*`<InMat, InOutMat, InOutMat>()` is `true`; and

(3.3) — *`compatible-static-extents`*`<InMat, InMat>(0, 1)` is `true`.

4 *Preconditions*:

(4.1) — *`multipliable`*`(A, B, B)` is `true`, and

(4.2) — `A.extent(0) == A.extent(1)` is `true`.

5 *Effects*: Computes X' such that $AX' = B$, and assigns each element of X' to the corresponding element of B. If so such X' exists, then the elements of `B` are valid but unspecified.

6 *Complexity*: $\mathcal{O}$(`B.extent(0)` $\times$ `A.extent(0)` $\times$ `A.extent(1)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_left_solve(InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B);
```

7 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(A, t, d, B, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_left_solve(ExecutionPolicy&& exec,
                                           InMat A, Triangle t, DiagonalStorage d,
                                           InOutMat B);
```

8 *Effects*: Equivalent to:

```
triangular_matrix_matrix_left_solve(std::forward<ExecutionPolicy>(exec),
                                    A, t, d, B, divides<void>{});
```

```
template<in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B, BinaryDivideOp divide);
template<class ExecutionPolicy, in-matrix InMat, class Triangle, class DiagonalStorage,
         inout-matrix InOutMat, class BinaryDivideOp>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B, BinaryDivideOp divide);
```

9 These functions perform multiple in-place matrix solves, taking into account the `Triangle` and `DiagonalStorage` parameters that apply to the triangular matrix `A` (29.9.3).

[*Note 3*: This algorithm makes it possible to compute factorizations like Cholesky and LU in place. Performing triangular solve in place hinders parallelization. However, other `ExecutionPolicy` specific optimizations, such as vectorization, are still possible. — *end note*]

10 *Mandates*:

(10.1) — If `InMat` has `layout_blas_packed` layout, then the layout's `Triangle` template argument has the same type as the function's `Triangle` template argument;

(10.2) — *possibly-multipliable*`<InOutMat, InMat, InOutMat>()` is `true`; and

(10.3) — *compatible-static-extents*`<InMat, InMat>(0, 1)` is `true`.

11 *Preconditions*:

(11.1) — *multipliable*`(B, A, B)` is `true`, and

(11.2) — `A.extent(0) == A.extent(1)` is `true`.

12 *Effects*: Computes X' such that $X'A = B$, and assigns each element of X' to the corresponding element of B. If so such X' exists, then the elements of `B` are valid but unspecified.

13 *Complexity*: $\mathcal{O}$(`A.extent(0)` $\times$ `A.extent(1)` $\times$ `B.extent(1)`).

```
template<in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_right_solve(InMat A, Triangle t, DiagonalStorage d, InOutMat B);
```

14 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(A, t, d, B, divides<void>{});
```

```
template<class ExecutionPolicy,
         in-matrix InMat, class Triangle, class DiagonalStorage, inout-matrix InOutMat>
  void triangular_matrix_matrix_right_solve(ExecutionPolicy&& exec,
                                            InMat A, Triangle t, DiagonalStorage d,
                                            InOutMat B);
```

15 *Effects*: Equivalent to:

```
triangular_matrix_matrix_right_solve(std::forward<ExecutionPolicy>(exec),
                                     A, t, d, B, divides<void>{});
```

29.10 Data-parallel types [simd]

29.10.1 General [simd.general]

1 Subclause 29.10 defines data-parallel types and operations on these types.

[*Note 1*: The intent is to support acceleration through data-parallel execution resources where available, such as SIMD registers and instructions or execution units driven by a common instruction decoder. SIMD stands for "Single Instruction Stream – Multiple Data Stream"; it is defined in Flynn 1966[21]. — *end note*]

2 The set of *vectorizable types* comprises

(2.1) — all standard integer types, character types, and the types `float` and `double` (6.9.2);

(2.2) — `std::float16_t`, `std::float32_t`, and `std::float64_t` if defined (6.9.3); and

(2.3) — `complex<T>` where `T` is a vectorizable floating-point type.

3 The term *data-parallel type* refers to all enabled specializations of the `basic_vec` and `basic_mask` class templates. A *data-parallel object* is an object of data-parallel type.

4 Each specialization of `basic_vec` or `basic_mask` is either enabled or disabled, as described in 29.10.7.1 and 29.10.9.1.

5 A data-parallel type consists of one or more elements of an underlying vectorizable type, called the *element type*. The number of elements is a constant for each data-parallel type and called the *width* of that type. The elements in a data-parallel type are indexed from 0 to width − 1.

6 An *element-wise operation* applies a specified operation to the elements of one or more data-parallel objects. Each such application is unsequenced with respect to the others. A *unary element-wise operation* is an element-wise operation that applies a unary operation to each element of a data-parallel object. A *binary element-wise operation* is an element-wise operation that applies a binary operation to corresponding elements of two data-parallel objects.

7 Given a `basic_mask<Bytes, Abi>` object `mask`, the *selected indices* signify the integers i in the range [`0`, `mask.size()`) for which `mask[`i`]` is `true`. Given a data-parallel object `data`, the *selected elements* signify the elements `data[`i`]` for all selected indices i.

8 The conversion from an arithmetic type `U` to a vectorizable type `T` is *value-preserving* if all possible values of `U` can be represented with type `T`.

9 If a program declares an explicit or partial specialization of any of the templates specified in subclause 29.10, the program is ill-formed, no diagnostic required.

29.10.2 Exposition-only types, variables, and concepts [simd.expos]

```
using simd-size-type = see below;                                   // exposition only

```

29.10.2.1 Exposition-only helpers [simd.expos.defn]

```
using simd-size-type = see below;
```

1 *simd-size-type* is an alias for a signed integer type.

```
template<size_t Bytes> using integer-from = see below;
```

2 *integer-from*<Bytes> is an alias for a signed integer type T such that sizeof(T) equals Bytes.

```
template<class T, class Abi>
  constexpr simd-size-type simd-size-v = see below;
```

3 *simd-size-v*<T, Abi> denotes the width of basic_vec<T, Abi> if the specialization basic_vec<T, Abi> is enabled, or 0 otherwise.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type mask-size-v = see below;
```

4 *mask-size-v*<Bytes, Abi> denotes the width of basic_mask<Bytes, Abi> if the specialization basic_mask<Bytes, Abi> is enabled, or 0 otherwise.

```
template<class T> constexpr size_t mask-element-size = see below;
```

5 *mask-element-size*<basic_mask<Bytes, Abi>> has the value Bytes.

```
template<class T> using deduced-vec-t = see below;
```

6 Let x denote an lvalue of type const T.

7 *deduced-vec-t*<T> is an alias for decltype(x + x).

```
template<class BinaryOperation, class T>
  concept reduction-binary-operation =
    requires (const BinaryOperation binary_op, const vec<T, 1> v) {
      { binary_op(v, v) } -> same_as<vec<T, 1>>;
    };
```

8 Types BinaryOperation and T model *reduction-binary-operation*<BinaryOperation, T> only if:

(8.1) — BinaryOperation is a binary element-wise operation and the operation is commutative.

(8.2) — An object of type BinaryOperation can be invoked with two arguments of type basic_vec<T, Abi>, with unspecified ABI tag Abi, returning a basic_vec<T, Abi>.

29.10.2.2 simd ABI tags [simd.expos.abi]

```
template<class T> using native-abi = see below;
```

```
template<class T, simd-size-type N> using deduce-abi-t = see below;
```

1 An *ABI tag* is a type that indicates a choice of size and binary representation for objects of data-parallel type.

[*Note 1*: The intent is for the size and binary representation to depend on the target architecture and compiler flags. The ABI tag, together with a given element type, implies the width. — *end note*]

2 [*Note 2*: The ABI tag is orthogonal to selecting the machine instruction set. The selected machine instruction set limits the usable ABI tag types, though (see 29.10.7.1). The ABI tags enable users to safely pass objects of data-parallel type between translation unit boundaries (e.g., function calls or I/O). — *end note*]

3 An implementation defines ABI tag types as necessary for the following aliases.

4 *deduce-abi-t*<T, N> names an ABI tag type if and only if

(4.1) — T is a vectorizable type,

(4.2) — N is greater than zero, and

(4.3) — N is not larger than an implementation-defined maximum.

Otherwise, *deduce-abi-t*<T, N> names an unspecified type. The implementation-defined maximum for N is not smaller than 64 and can differ depending on T.

5 If *deduce-abi-t*<T, N> names an ABI tag type, the following is true:

(5.1) — *simd-size-v*<T, *deduce-abi-t*<T, N>> equals N, and

(5.2) — basic_vec<T, *deduce-abi-t*<T, N>> is enabled (29.10.7.1).

6 *native-abi*<T> is an implementation-defined alias for an ABI tag. basic_vec<T, *native-abi*<T>> is an enabled specialization.

[*Note 3*: The intent is to use the ABI tag producing the most efficient data-parallel execution for the element type T on the currently targeted system. For target architectures with ISA extensions, compiler flags can change the type of the *native-abi*<T> alias. — *end note*]

[*Example 1*: Consider a target architecture supporting the ABI tags __simd128 and __simd256, where hardware support for __simd256 exists only for floating-point types. The implementation therefore defines *native-abi*<T> as an alias for

(6.1) — __simd256 if T is a floating-point type, and

(6.2) — __simd128 otherwise.

— *end example*]

29.10.4 Type traits [simd.traits]

```
template<class T, class U = typename T::value_type> struct alignment { see below };
```

1 `alignment<T, U>` has a member `value` if and only if `T` is a specialization of `basic_vec` and `U` is a vectorizable type.

2 If `value` is present, the type `alignment<T, U>` is a `BinaryTypeTrait` with a base characteristic of `integral_constant<size_t, N>` for some unspecified `N` (29.10.7.2, 29.10.8.6).

[*Note 1*: `value` identifies the alignment restrictions on pointers used for (converting) loads and stores for the given type `T` on arrays of type `U`. — *end note*]

```
template<class T, class V> struct rebind { using type = see below; };
```

3 The member `type` is present if and only if

(3.1) — `V` is a data-parallel type,

(3.2) — `T` is a vectorizable type, and

(3.3) — *`deduce-abi-t`*`<T, V::size()>` names an ABI tag type.

4 If `V` is a specialization of `basic_vec`, let `Abi1` denote an ABI tag such that `basic_vec<T, Abi1>::size()` equals `V::size()`. If `V` is a specialization of `basic_mask`, let `Abi1` denote an ABI tag such that `basic_mask<sizeof(T), Abi1>::size()` equals `V::size()`.

5 Where present, the member typedef `type` names `basic_vec<T, Abi1>` if `V` is a specialization of `basic_vec` or `basic_mask<sizeof(T), Abi1>` if `V` is a specialization of `basic_mask`.

`template<`*`simd-size-type`* `N, class V> struct resize { using type =` *`see below`*`; };`

6 Let `Abi1` denote an ABI tag

(6.1) — such that *`simd-size-v`*`<typename V::value_type, Abi1>` equals `N` if `V` is a specialization of `basic_vec`,

(6.2) — otherwise such that *`mask-size-v`*`<`*`mask-element-size`*`<V>, Abi1>` equals `N` if `V` is a specialization of `basic_mask`.

7 The member `type` is present if and only if

(7.1) — `V` is a data-parallel type, and

(7.2) — there exists at least one ABI tag that satisfies the above constraints for `Abi1`.

8 Where present, the member typedef `type` names `basic_vec<typename V::value_type, Abi1>` if `V` is a specialization of `basic_vec`, or `basic_mask<`*`mask-element-size`*`<V>, Abi1>` if `V` is a specialization of `basic_mask`.

29.10.5 Load and store flags [simd.flags]

29.10.5.1 Class template `flags` overview [simd.flags.overview]

```
namespace std::simd {
  template<class... Flags> struct flags {
    // 29.10.5.2, flags operators
    template<class... Other>
      friend consteval auto operator|(flags, flags<Other...>);
  };
}
```

1 [*Note 1*: The class template `flags` acts like an integer bit-flag for types. — *end note*]

2 *Constraints*: Every type in the parameter pack `Flags` is one of *`convert-flag`*, *`aligned-flag`*, or *`over-aligned-flag`*`<N>`.

29.10.5.2 `flags` operators [simd.flags.oper]

```
template<class... Other>
  friend consteval auto operator|(flags a, flags<Other...> b);
```

1 *Returns*: A default-initialized object of type `flags<Flags2...>` for some `Flags2` where every type in `Flags2` is present either in template parameter pack `Flags` or in template parameter pack `Other`, and every type in template parameter packs `Flags` and `Other` is present in `Flags2`. If the packs `Flags` and `Other` contain two different specializations *`overaligned-flag`*`<N1>` and *`overaligned-flag`*`<N2>`, `Flags2` is not required to contain the specialization *`overaligned-flag`*`<std::min(N1, N2)>`.

29.10.6 Class template *`simd-iterator`* [simd.iterator]

```
namespace std::simd {
  template<class V>
  class simd-iterator {                                          // exposition only
    V* data_ = nullptr;                                          // exposition only
    simd-size-type offset_ = 0;                                  // exposition only

    constexpr simd-iterator(V& d, simd-size-type off) noexcept;  // exposition only

  public:
    using value_type = V::value_type;
    using iterator_category = input_iterator_tag;
    using iterator_concept = random_access_iterator_tag;
    using difference_type = simd-size-type;

    constexpr simd-iterator() = default;

    constexpr simd-iterator(const simd-iterator&) = default;
    constexpr simd-iterator& operator=(const simd-iterator&) = default;
```

```
    constexpr simd-iterator(const simd-iterator<remove_const_t<V>>&) requires is_const_v<V>;

    constexpr value_type operator*() const;

    constexpr simd-iterator& operator++();
    constexpr simd-iterator operator++(int);
    constexpr simd-iterator& operator--();
    constexpr simd-iterator operator--(int);

    constexpr simd-iterator& operator+=(difference_type n);
    constexpr simd-iterator& operator-=(difference_type n);

    constexpr value_type operator[](difference_type n) const;

    friend constexpr bool operator==(simd-iterator a, simd-iterator b) = default;
    friend constexpr bool operator==(simd-iterator a, default_sentinel_t) noexcept;
    friend constexpr auto operator<=>(simd-iterator a, simd-iterator b);

    friend constexpr simd-iterator operator+(simd-iterator i, difference_type n);
    friend constexpr simd-iterator operator+(difference_type n, simd-iterator i);
    friend constexpr simd-iterator operator-(simd-iterator i, difference_type n);

    friend constexpr difference_type operator-(simd-iterator a, simd-iterator b);
    friend constexpr difference_type operator-(simd-iterator i, default_sentinel_t) noexcept;
    friend constexpr difference_type operator-(default_sentinel_t, simd-iterator i) noexcept;
  };
}
```

`constexpr simd-iterator(V& d, simd-size-type off) noexcept;`

1 *Effects*: Initializes *data_* with `addressof(d)` and *offset_* with `off`.

`constexpr simd-iterator(const simd-iterator<remove_const_t<V>>& i) requires is_const_v<V>;`

2 *Effects*: Initializes *data_* with `i.`*data_* and *offset_* with `i.`*offset_*.

`constexpr value_type operator*() const;`

3 *Effects*: Equivalent to: `return (*`*data_*`)[`*offset_*`];`

`constexpr simd-iterator& operator++();`

4 *Effects*: Equivalent to: `return *this += 1;`

`constexpr simd-iterator operator++(int);`

5 *Effects*: Equivalent to:

```

©ISO/IEC

```
    friend constexpr mask_type operator>(const basic_vec&, const basic_vec&) noexcept;
    friend constexpr mask_type operator<(const basic_vec&, const basic_vec&) noexcept;

    // 29.10.8.4, basic_vec exposition only conditional operators
    friend constexpr basic_vec simd-select-impl( // exposition only
      const mask_type&, const basic_vec&, const basic_vec&) noexcept;
  };

  template<class R, class... Ts>
    basic_vec(R&& r, Ts...) -> see below;

  template<size_t Bytes, class Abi>
    basic_vec(basic_mask<Bytes, Abi>) -> see below;
}
```

1 Every specialization of `basic_vec` is a complete type. The specialization of `basic_vec<T, Abi>` is

(1.1) — enabled, if `T` is a vectorizable type, and there exists value `N` in the range $[1, 64]$, such that `Abi` names the ABI tag denoted by *`deduce-abi-t`*`<T, N>`,

(1.2) — otherwise, disabled, if `T` is not a vectorizable type,

(1.3) — otherwise, it is implementation-defined if such a specialization is enabled.

If `basic_vec<T, Abi>` is disabled, then the specialization has a deleted default constructor, deleted destructor, deleted copy constructor, and deleted copy assignment. In addition only the `value_type`, `abi_type`, and `mask_type` members are present.

If `basic_vec<T, Abi>` is enabled, then

(1.4) — `basic_vec<T, Abi>` is trivially copyable,

(1.5) — default-initialization of an object of such a type default-initializes all elements,

(1.6) — value-initialization value-initializes all elements (9.5.1),

(1.7) — `basic_vec<T, Abi>::mask_type` is an alias for an enabled specialization of `basic_mask`, and

(1.8) — `basic_vec<T, Abi>::size()` is equal to `basic_vec<T, Abi>::mask_type::size()`.

2 *Recommended practice*: Implementations should support implicit conversions between specializations of `basic_vec` and appropriate implementation-defined types.

[*Note 1*: Appropriate types are non-standard vector types which are available in the implementation. — *end note*]

3 If `T` is a specialization of `complex`, *`real-type`* denotes the same type as `rebind_t<typename T::value_type, basic_vec<T, Abi>>`, otherwise an unspecified non-array object type.

29.10.7.2 Constructors [simd.ctor]

```
template<class U> constexpr basic_vec(U&& value) noexcept;
```

1 Let `From` denote the type `remove_cvref_t<U>`.

2 *Constraints*:

(2.1) — `U` satisfies `convertible_to<value_type>` and `From` is not an arithmetic type and does not satisfy *`constexpr-wrapper-like`*,

(2.2) — `From` is an arithmetic type and the conversion from `From` to `value_type` is value-preserving (29.10.1), or

(2.3) — `From` satisfies *`constexpr-wrapper-like`*, `remove_cvref_t<decltype(From::value)>` is an arithmetic type, and `From::value` is representable by `value_type`.

3 *Effects*: Initializes each element to the value of the argument after conversion to `value_type`.

```
template<class U, class UAbi>
  constexpr explicit(see below) basic_vec(const basic_vec<U, UAbi>& x) noexcept;
```

4 *Constraints*:

(4.1) — *`simd-size-v`*`<U, UAbi> == size()` is `true`, and

(4.2) — `U` satisfies *`explicitly-convertible-to`*`<T>`.

5 *Effects*: Initializes the i^{th} element with `static_cast<T>(x[`i`])` for all i in the range of $[0, \texttt{size()})$.

6 *Remarks*: The expression inside `explicit` evaluates to `true` if either

(6.1) — the conversion from `U` to `value_type` is not value-preserving, or

(6.2) — both `U` and `value_type` are integral types and the integer conversion rank (6.9.6) of `U` is greater than the integer conversion rank of `value_type`, or

(6.3) — both `U` and `value_type` are floating-point types and the floating-point conversion rank (6.9.6) of `U` is greater than the floating-point conversion rank of `value_type`.

```
template<class G> constexpr explicit basic_vec(G&& gen);
```

7 Let $\texttt{From}_i$ denote the type `decltype(gen(integral_constant<`*simd-size-type*`,` i`>()))`.

8 *Constraints*: $\texttt{From}_i$ satisfies `convertible_to<value_type>` for all i in the range of $[0, \texttt{size()})$. In addition, for all i in the range of $[0, \texttt{size()})$, if $\texttt{From}_i$ is an arithmetic type, conversion from $\texttt{From}_i$ to `value_type` is value-preserving.

9 *Effects*: Initializes the i^{th} element with `static_cast<value_type>(gen(integral_constant<`*simd-size-type*`, i>()))` for all i in the range of $[0, \texttt{size()})$.

10 *Remarks*: `gen` is invoked exactly once for each i, in increasing order of i.

```
template<class R, class... Flags>
  constexpr basic_vec(R&& r, flags<Flags...> = {});
template<class R, class... Flags>
  constexpr basic_vec(R&& r, const mask_type& mask, flags<Flags...> = {});
```

11 Let `mask` be `mask_type(true)` for the overload with no `mask` parameter.

12 *Constraints*:

(12.1) — `R` models `ranges::contiguous_range` and `ranges::sized_range`,

(12.2) — `ranges::size(r)` is a constant expression,

(12.3) — `ranges::size(r)` is equal to `size()`, and

(12.4) — `ranges::range_value_t<R>` is a vectorizable type and satisfies *`explicitly-convertible-to`*`<T>`.

13 *Mandates*: If the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `ranges::range_value_t<R>` to `value_type` is value-preserving.

14 *Preconditions*:

(14.1) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(r)` points to storage aligned by `alignment_v<basic_vec, ranges::range_value_t<R>>`.

(14.2) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(r)` points to storage aligned by `N`.

15 *Effects*: Initializes the i^{th} element with `mask[`i`] ? static_cast<T>(ranges::data(r)[`i`]) : T()` for all i in the range of $[0, \texttt{size()})$.

```
template<class R, class... Ts>
  basic_vec(R&& r, Ts...) -> see below;
```

16 *Constraints*:

(16.1) — `R` models `ranges::contiguous_range` and `ranges::sized_range`, and

(16.2) — `ranges::size(r)` is a constant expression.

17 *Remarks*: The deduced type is equivalent to

```
vec<ranges::range_value_t<R>, static_cast<simd-size-type>(ranges::size(r))>
```

```
template<size_t Bytes, class Abi>
  basic_vec(basic_mask<Bytes, Abi> k) -> see below;
```

18 *Constraints*: `basic_mask<Bytes, Abi>` is an enabled specialization of `basic_mask` and `decltype(+k)` is a valid type.

19 *Remarks*: The deduced type is equivalent to `decltype(+k)`.

©ISO/IEC

```
constexpr basic_vec(const real-type& reals, const real-type& imags = {}) noexcept;
```

20 *Constraints*: *simd-complex*<basic_vec> is modeled.

21 *Effects*: Initializes the i^{th} element with `value_type(reals[`i`], imags[`i`])` for all i in the range $[0, \texttt{size()})$.

29.10.7.3 Subscript operator [simd.subscr]

```
constexpr value_type operator[](simd-size-type i) const;
```

1 *Preconditions*: `i >= 0 && i < size()` is `true`.

2 *Returns*: The value of the i^{th} element.

3 *Throws*: Nothing.

```
template<simd-integral I>
  constexpr resize_t<I::size(), basic_vec> operator[](const I& indices) const;
```

4 *Effects*: Equivalent to: `return permute(*this, indices);`

29.10.7.4 Complex accessors [simd.complex.access]

```
constexpr real-type real() const noexcept;
constexpr real-type imag() const noexcept;
```

1 *Constraints*: *simd-complex*<basic_vec> is modeled.

2 *Returns*: An object of type *real-type* where the i^{th} element is initialized to the result of *cmplx-func*`(operator[](`i`))` for all i in the range $[0, \texttt{size()})$, where *cmplx-func* is the corresponding function from <complex>.

```
constexpr void real(const real-type& v) noexcept;
constexpr void imag(const real-type& v) noexcept;
```

3 *Constraints*: *simd-complex*<basic_vec> is modeled.

4 *Effects*: Replaces each element of the `basic_vec` object such that the i^{th} element is replaced with `value_type(v[`i`], operator[](`i`).imag())` or `value_type(operator[](`i`).real(), v[`i`])` for `real` and `imag` respectively, for all i in the range $[0, \texttt{size()})$.

29.10.7.5 Unary operators [simd.unary]

1 Effects in 29.10.7.5 are applied as unary element-wise operations.

```
constexpr basic_vec& operator++() noexcept;
```

2 *Constraints*: `requires (value_type a) { ++a; }` is `true`.

3 *Effects*: Increments every element by one.

4 *Returns*: `*this`.

```
constexpr basic_vec operator++(int) noexcept;
```

5 *Constraints*: `requires (value_type a) { a++; }` is `true`.

6 *Effects*: Increments every element by one.

7 *Returns*: A copy of `*this` before incrementing.

```
constexpr basic_vec& operator--() noexcept;
```

8 *Constraints*: `requires (value_type a) { --a; }` is `true`.

9 *Effects*: Decrements every element by one.

10 *Returns*: `*this`.

```
constexpr basic_vec operator--(int) noexcept;
```

11 *Constraints*: `requires (value_type a) { a--; }` is `true`.

12 *Effects*: Decrements every element by one.

13 *Returns*: A copy of `*this` before decrementing.

```
constexpr mask_type operator!() const noexcept;
```

14 *Constraints*: `requires (const value_type a) { !a; }` is `true`.

15 *Returns*: A `basic_mask` object with the i^{th} element set to `!operator[](`i`)` for all i in the range of $[0, \texttt{size()})$.

```
constexpr basic_vec operator~() const noexcept;
```

16 *Constraints*: `requires (const value_type a) { ~a; }` is `true`.

17 *Returns*: A `basic_vec` object with the i^{th} element set to `~operator[](`i`)` for all i in the range of $[0, \texttt{size()})$.

```
constexpr basic_vec operator+() const noexcept;
```

18 *Constraints*: `requires (const value_type a) { +a; }` is `true`.

19 *Returns*: `*this`.

```
constexpr basic_vec operator-() const noexcept;
```

20 *Constraints*: `requires (const value_type a) { -a; }` is `true`.

21 *Returns*: A `basic_vec` object where the i^{th} element is initialized to `-operator[](`i`)` for all i in the range of $[0, \texttt{size()})$.

29.10.8 `basic_vec` non-member operations [simd.nonmembers]

29.10.8.1 Binary operators [simd.binary]

```
friend constexpr basic_vec operator+(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator-(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator*(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator/(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator%(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator&(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator|(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator^(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator<<(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec operator>>(const basic_vec& lhs, const basic_vec& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a` *op* `b; }` is `true`.

3 *Returns*: A `basic_vec` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

```
friend constexpr basic_vec operator<<(const basic_vec& v, simd-size-type n) noexcept;
friend constexpr basic_vec operator>>(const basic_vec& v, simd-size-type n) noexcept;
```

4 Let *op* be the operator.

5 *Constraints*: `requires (value_type a,` *simd-size-type* `b) { a` *op* `b; }` is `true`.

6 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of applying *op* to `v[`i`]` and `n` for all i in the range of $[0, \texttt{size()})$.

29.10.8.2 Compound assignment [simd.cassign]

```
friend constexpr basic_vec& operator+=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator-=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator*=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator/=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator%=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator&=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator|=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator^=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator<<=(basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr basic_vec& operator>>=(basic_vec& lhs, const basic_vec& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a op b; }` is `true`.

3 *Effects*: These operators apply the indicated operator to `lhs` and `rhs` as an element-wise operation.

4 *Returns*: `lhs`.

```
friend constexpr basic_vec& operator<<=(basic_vec& lhs, simd-size-type n) noexcept;
friend constexpr basic_vec& operator>>=(basic_vec& lhs, simd-size-type n) noexcept;
```

5 Let *op* be the operator.

6 *Constraints*: `requires (value_type a, simd-size-type b) { a op b; }` is `true`.

7 *Effects*: Equivalent to: `return operator op (lhs, basic_vec(n));`

29.10.8.3 Comparison operators [simd.comparison]

```
friend constexpr mask_type operator==(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr mask_type operator!=(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr mask_type operator>=(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr mask_type operator<=(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr mask_type operator>(const basic_vec& lhs, const basic_vec& rhs) noexcept;
friend constexpr mask_type operator<(const basic_vec& lhs, const basic_vec& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Constraints*: `requires (value_type a, value_type b) { a op b; }` is `true`.

3 *Returns*: A `basic_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.8.4 Exposition-only conditional operators [simd.cond]

```
friend constexpr basic_vec
simd-select-impl(const mask_type& mask, const basic_vec& a, const basic_vec& b) noexcept;
```

1 *Returns*: A `basic_vec` object where the i^{th} element equals `mask[`i`] ? a[`i`] : b[`i`]` for all i in the range of $[0, \texttt{size()})$.

29.10.8.5 Reductions [simd.reductions]

```
template<class T, class Abi, class BinaryOperation = plus<>>
  constexpr T reduce(const basic_vec<T, Abi>& x, BinaryOperation binary_op = {});
```

1 *Constraints*: `BinaryOperation` models *reduction-binary-operation*`<T>`.

2 *Preconditions*: `binary_op` does not modify `x`.

3 *Returns*: *GENERALIZED_SUM*`(binary_op, vec<T, 1>(x[0]), ..., vec<T, 1>(x[x.size() - 1]))[0]` (26.10.2).

4 *Throws*: Any exception thrown from `binary_op`.

```
template<class T, class Abi, class BinaryOperation = plus<>>
  constexpr T reduce(
    const basic_vec<T, Abi>& x, const typename basic_vec<T, Abi>::mask_type& mask,
    BinaryOperation binary_op = {}, type_identity_t<T> identity_element = see below);
```

5 *Constraints*:

(5.1) — `BinaryOperation` models *reduction-binary-operation*`<T>`.

(5.2) — An argument for `identity_element` is provided for the invocation, unless `BinaryOperation` is one of `plus<>`, `multiplies<>`, `bit_and<>`, `bit_or<>`, or `bit_xor<>`.

6 *Preconditions*:

(6.1) — `binary_op` does not modify `x`.

(6.2) — For all finite values `y` representable by `T`, the results of `y == binary_op(vec<T, 1>(identity_element), vec<T, 1>(y))[0]` and `y == binary_op(vec<T, 1>(y), vec<T, 1>(identity_element))[0]` are `true`.

7 *Returns*: If `none_of(mask)` is `true`, returns `identity_element`. Otherwise, returns *`GENERALIZED_SUM`*`(binary_op, vec<T, 1>(x[`k_0`]), ..., vec<T, 1>(x[`k_n`]))[0]` where $k_0, \ldots, k_n$ are the selected indices of `mask`.

8 *Throws*: Any exception thrown from `binary_op`.

9 *Remarks*: The default argument for `identity_element` is equal to

(9.1) — `T()` if `BinaryOperation` is `plus<>`,

(9.2) — `T(1)` if `BinaryOperation` is `multiplies<>`,

(9.3) — `T(~T())` if `BinaryOperation` is `bit_and<>`,

(9.4) — `T()` if `BinaryOperation` is `bit_or<>`, or

(9.5) — `T()` if `BinaryOperation` is `bit_xor<>`.

```
template<class T, class BinaryOperation = plus<>>
  constexpr T reduce(const T& x, BinaryOperation binary_op = {});
template<class T, class BinaryOperation = plus<>>
  constexpr T reduce(const T& x, same_as<bool> auto mask, BinaryOperation binary_op = {},
                     type_identity_t<T> identity_element = see below);
```

10 Let `mask` be `true` for the overload with no `mask` parameter.

11 *Constraints*:

(11.1) — `T` is vectorizable.

(11.2) — `BinaryOperation` models *`reduction-binary-operation`*`<T>`.

(11.3) — An argument for `identity_element` is provided for the invocation, unless `BinaryOperation` is one of `plus<>`, `multiplies<>`, `bit_and<>`, `bit_or<>`, or `bit_xor<>`.

12 *Returns*: If `mask` is `false`, returns `identity_element`. Otherwise, returns `x`.

13 *Throws*: Nothing.

14 *Remarks*: The default argument for `identity_element` is equal to

(14.1) — `T()` if `BinaryOperation` is `plus<>`,

(14.2) — `T(1)` if `BinaryOperation` is `multiplies<>`,

(14.3) — `T(~T())` if `BinaryOperation` is `bit_and<>`,

(14.4) — `T()` if `BinaryOperation` is `bit_or<>`, or

(14.5) — `T()` if `BinaryOperation` is `bit_xor<>`.

```
template<class T, class Abi> constexpr T reduce_min(const basic_vec<T, Abi>& x) noexcept;
```

15 *Constraints*: `T` models `totally_ordered`.

16 *Returns*: The value of an element `x[`j`]` for which `x[`i`] < x[`j`]` is `false` for all i in the range of $[0, $`basic_vec<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr T reduce_min(
    const basic_vec<T, Abi>&, const typename basic_vec<T, Abi>::mask_type&) noexcept;
```

17 *Constraints*: `T` models `totally_ordered`.

18 *Returns*: If `none_of(mask)` is `true`, returns `numeric_limits<T>::max()`. Otherwise, returns the value of a selected element `x[`j`]` for which `x[`i`] < x[`j`]` is `false` for all selected indices i of `mask`.

```
template<class T, class Abi> constexpr T reduce_max(const basic_vec<T, Abi>& x) noexcept;
```

19 *Constraints*: `T` models `totally_ordered`.

20 *Returns*: The value of an element `x[`j`]` for which `x[`j`] < x[`i`]` is `false` for all i in the range of $[0, $`basic_vec<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr T reduce_max(
    const basic_vec<T, Abi>&, const typename basic_vec<T, Abi>::mask_type&) noexcept;
```

21 *Constraints*: `T` models `totally_ordered`.

22 *Returns*: If `none_of(mask)` is `true`, returns `numeric_limits<V::value_type>::lowest()`. Otherwise, returns the value of a selected element `x[`j`]` for which `x[`j`] < x[`i`]` is `false` for all selected indices i of `mask`.

```
template<class T> constexpr T reduce_min(const T& x) noexcept;
template<class T> constexpr T reduce_min(const T& x, same_as<bool> auto mask) noexcept;
template<class T> constexpr T reduce_max(const T& x) noexcept;
template<class T> constexpr T reduce_max(const T& x, same_as<bool> auto mask) noexcept;
```

23 Let `mask` be `true` for the overloads with no `mask` parameter.

24 *Constraints*:

(24.1) — `T` is vectorizable.

(24.2) — `T` models `totally_ordered`.

25 *Returns*: If `mask` is `false`, returns `numeric_limits<T>::max()` for `reduce_min` and `numeric_limits<T>::lowest()` for `reduce_max`. Otherwise, returns `x`.

29.10.8.6 Load and store functions [simd.loadstore]

```
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_load(R&& r, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_load(R&& r, const typename V::mask_type& mask, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V unchecked_load(I first, iter_difference_t<I> n, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V unchecked_load(I first, iter_difference_t<I> n, const typename V::mask_type& mask,
                             flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V unchecked_load(I first, S last, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V unchecked_load(I first, S last, const typename V::mask_type& mask,
                             flags<Flags...> f = {});
```

1 Let

(1.1) — `mask` be `V::mask_type(true)` for the overloads with no `mask` parameter;

(1.2) — `R` be `span<const iter_value_t<I>>` for the overloads with no template parameter `R`;

(1.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

2 *Mandates*: If `ranges::size(r)` is a constant expression then `ranges::size(r)` $\geq$ `V::size()`.

3 *Preconditions*:

(3.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(3.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(3.3) — `ranges::size(r)` $\geq$ `V::size()`

4 *Effects*: Equivalent to: `return partial_load<V>(r, mask, f);`

5 *Remarks*: The default argument for template parameter `V` is `basic_vec<ranges::range_value_t<R>>`.

```
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_load(R&& r, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_load(R&& r, const typename V::mask_type& mask, flags<Flags...> f = {});
```

```
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V partial_load(I first, iter_difference_t<I> n, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, class... Flags>
  constexpr V partial_load(I first, iter_difference_t<I> n, const typename V::mask_type& mask,
                           flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V partial_load(I first, S last, flags<Flags...> f = {});
template<class V = see below, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr V partial_load(I first, S last, const typename V::mask_type& mask,
                           flags<Flags...> f = {});
```

6 Let

(6.1) — `mask` be `V::mask_type(true)` for the overloads with no `mask` parameter;

(6.2) — `R` be `span<const iter_value_t<I>>` for the overloads with no template parameter `R`;

(6.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter;

(6.4) — `T` be `typename V::value_type`.

7 *Mandates*:

(7.1) — `ranges::range_value_t<R>` is a vectorizable type and satisfies *`explicitly-convertible-to`*`<T>`,

(7.2) — `same_as<remove_cvref_t<V>, V>` is `true`,

(7.3) — `V` is an enabled specialization of `basic_vec`, and

(7.4) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `ranges::range_value_t<R>` to `V::value_type` is value-preserving.

8 *Preconditions*:

(8.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(8.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(8.3) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(r)` points to storage aligned by `alignment_v<V, ranges::range_value_t<R>>`.

(8.4) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(r)` points to storage aligned by `N`.

9 *Returns*: A `basic_vec` object whose i^{th} element is initialized with `mask[`i`] && `i` < ranges::size(r) ? static_cast<T>(ranges::data(r)[`i`]) : T()` for all i in the range of [`0`, `V::size()`), where `T` is `V::value_type`.

10 *Remarks*: The default argument for template parameter `V` is `basic_vec<ranges::range_value_t<R>>`.

```
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, R&& r, flags<Flags...> f = {});
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, R&& r,
                                 const typename basic_vec<T, Abi>::mask_type& mask,
                                 flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, I first, iter_difference_t<I> n,
                                 flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, I first, iter_difference_t<I> n,
                                 const typename basic_vec<T, Abi>::mask_type& mask,
                                 flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, I first, S last,
                                 flags<Flags...> f = {});
```

```
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr void unchecked_store(const basic_vec<T, Abi>& v, I first, S last,
                                 const typename basic_vec<T, Abi>::mask_type& mask,
                                 flags<Flags...> f = {});
```

11 Let

(11.1) — `mask` be `basic_vec<T, Abi>::mask_type(true)` for the overloads with no `mask` parameter;

(11.2) — `R` be `span<iter_value_t<I>>` for the overloads with no template parameter `R`;

(11.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

12 *Mandates*: If `ranges::size(r)` is a constant expression then `ranges::size(r)` $\geq$ *`simd-size-v`*`<T, Abi>`.

13 *Preconditions*:

(13.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(13.2) — [`first`, `last`) is a valid range for the overloads with a `last` parameter.

(13.3) — `ranges::size(r)` $\geq$ *`simd-size-v`*`<T, Abi>`

14 *Effects*: Equivalent to: `partial_store(v, r, mask, f)`.

```
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr void partial_store(const basic_vec<T, Abi>& v, R&& r, flags<Flags...> f = {});
template<class T, class Abi, ranges::contiguous_range R, class... Flags>
  requires ranges::sized_range<R>
  constexpr void partial_store(const basic_vec<T, Abi>& v, R&& r,
                               const typename basic_vec<T, Abi>::mask_type& mask,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  constexpr void partial_store(const basic_vec<T, Abi>& v, I first, iter_difference_t<I> n,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, class... Flags>
  constexpr void partial_store(const basic_vec<T, Abi>& v, I first, iter_difference_t<I> n,
                               const typename basic_vec<T, Abi>::mask_type& mask,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr void partial_store(const basic_vec<T, Abi>& v, I first, S last,
                               flags<Flags...> f = {});
template<class T, class Abi, contiguous_iterator I, sized_sentinel_for<I> S, class... Flags>
  constexpr void partial_store(const basic_vec<T, Abi>& v, I first, S last,
                               const typename basic_vec<T, Abi>::mask_type& mask,
                               flags<Flags...> f = {});
```

15 Let

(15.1) — `mask` be `basic_vec<T, Abi>::mask_type(true)` for the overloads with no `mask` parameter;

(15.2) — `R` be `span<iter_value_t<I>>` for the overloads with no template parameter `R`;

(15.3) — `r` be `R(first, n)` for the overloads with an `n` parameter and `R(first, last)` for the overloads with a `last` parameter.

16 *Constraints*:

(16.1) — `ranges::iterator_t<R>` models `indirectly_writable<ranges::range_value_t<R>>`, and

(16.2) — `T` satisfies *`explicitly-convertible-to`*`<ranges::range_value_t<R>>`.

17 *Mandates*:

(17.1) — `ranges::range_value_t<R>` is a vectorizable type, and

(17.2) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `T` to `ranges::range_value_t<R>` is value-preserving.

18 *Preconditions*:

(18.1) — [`first`, `first + n`) is a valid range for the overloads with an `n` parameter.

(18.2) — [first, last) is a valid range for the overloads with a last parameter.

(18.3) — If the template parameter pack Flags contains *aligned-flag*, ranges::data(r) points to storage aligned by alignment_v<basic_vec<T, Abi>, ranges::range_value_t<R>>.

(18.4) — If the template parameter pack Flags contains *overaligned-flag*<N>, ranges::data(r) points to storage aligned by N.

19 *Effects*: For all i in the range of [0, basic_vec<T, Abi>::size()), if mask[i] && i < ranges::size(r) is true, evaluates ranges::data(r)[i] = static_cast<ranges::range_value_t<R>>(v[i]).

29.10.8.7 Static permute [simd.permute.static]

```
template<simd-size-type N = see below, simd-vec-type V, class IdxMap>
  constexpr resize_t<N, V> permute(const V& v, IdxMap&& idxmap);
template<simd-size-type N = see below, simd-mask-type V, class IdxMap>
  constexpr resize_t<N, V> permute(const V& v, IdxMap&& idxmap);
```

1 Let:

(1.1) — *gen-fn*(i) be idxmap(i, V::size()) if that expression is well-formed, and idxmap(i) otherwise.

(1.2) — *perm-fn* be the following exposition-only function template:

```
template<simd-size-type I>
typename V::value_type perm-fn() {
  constexpr auto src_index = gen-fn(I);
  if constexpr (src_index == zero_element) {
    return typename V::value_type();
  } else if constexpr (src_index == uninit_element) {
    return unspecified-value;
  } else {
    return v[src_index];
  }
}
```

2 *Constraints*: At least one of invoke_result_t<IdxMap&, *simd-size-type*> and invoke_result_t<IdxMap&, *simd-size-type*, *simd-size-type*> satisfies integral.

3 *Mandates*: *gen-fn*(i) is a constant expression whose value is zero_element, uninit_element, or in the range [0, V::size()), for all i in the range [0, N).

4 *Returns*: A data-parallel object where the i^{th} element is initialized to the result of *perm-fn*<i>() for all i in the range [0, N).

5 *Remarks*: The default argument for template parameter N is V::size().

29.10.8.8 Dynamic permute [simd.permute.dynamic]

```
template<simd-vec-type V, simd-integral I>
  constexpr resize_t<I::size(), V> permute(const V& v, const I& indices);
template<simd-mask-type V, simd-integral I>
  constexpr resize_t<I::size(), V> permute(const V& v, const I& indices);
```

1 *Preconditions*: All values in indices are in the range [0, V::size()).

2 *Returns*: A data-parallel object where the i^{th} element is initialized to the result of v[indices[i]] for all i in the range [0, I::size()).

29.10.8.9 Mask permute [simd.permute.mask]

```
template<simd-vec-type V>
  constexpr V compress(const V& v, const typename V::mask_type& selector);
template<simd-mask-type V>
  constexpr V compress(const V& v, const type_identity_t<V>& selector);
```

1 Let:

(1.1) — *bit-index*(i) be a function which returns the index of the i^{th} element of selector that is true.

(1.2) — *select-value*(i) be a function which returns v[*bit-index*(i)] for i in the range [0, reduce_count(selector)) and a valid but unspecified value otherwise.

[*Note 1*: Different calls to *`select-value`* can return different unspecified values. — *end note*]

2 *Returns*: A data-parallel object where the i^{th} element is initialized to the result of *`select-value`*(*i*) for all *i* in the range [`0`, `V::size()`).

```
template<simd-vec-type V>
  constexpr V compress(const V& v, const typename V::mask_type& selector,
                       const typename V::value_type& fill_value);
template<simd-mask-type V>
  constexpr V compress(const V& v, const type_identity_t<V>& selector,
                       const typename V::value_type& fill_value);
```

3 Let:

(3.1) — *`bit-index`*(*i*) be a function which returns the index of the i^{th} element of `selector` that is `true`.

(3.2) — *`select-value`*(*i*) be a function which returns `v[`*`bit-index`*`(`*i*`)]` for *i* in the range [`0`, `reduce_count(selector)`) and `fill_value` otherwise.

4 *Returns*: A data-parallel object where the i^{th} element is initialized to the result of *`select-value`*(*i*) for all *i* in the range [`0`, `V::size()`).

```
template<simd-vec-type V>
  constexpr V expand(const V& v, const typename V::mask_type& selector, const V& original = {});
template<simd-mask-type V>
  constexpr V expand(const V& v, const type_identity_t<V>& selector, const V& original = {});
```

5 Let:

(5.1) — *`set-indices`* be a list of the index positions of `true` elements in `selector`, in ascending order.

(5.2) — *`bit-lookup`*(*b*) be a function which returns the index where *b* appears in *`set-indices`*.

(5.3) — *`select-value`*(*i*) be a function which returns `v[`*`bit-lookup`*`(`*i*`)]` if `selector[`*i*`]` is `true`, otherwise returns `original[`*i*`]`.

6 *Returns*: A data-parallel object where the i^{th} element is initialized to the result of *`select-value`*(*i*) for all *i* in the range [`0`, `V::size()`).

29.10.8.10 Memory permute [simd.permute.memory]

```
template<class V = see below, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_gather_from(R&& in, const I& indices, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr V unchecked_gather_from(R&& in, const typename I::mask_type& mask,
                                    const I& indices, flags<Flags...> f = {});
```

1 Let `mask` be `typename I::mask_type(true)` for the overload with no `mask` parameter.

2 *Preconditions*: All values in `select(mask, indices, typename I::value_type())` are in the range [`0`, `ranges::size(in)`).

3 *Effects*: Equivalent to: `return partial_gather_from<V>(in, mask, indices, f);`

4 *Remarks*: The default argument for template parameter `V` is `vec<ranges::range_value_t<R>, I::size()>`.

```
template<class V = see below, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_gather_from(R&& in, const I& indices, flags<Flags...> f = {});
template<class V = see below, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr V partial_gather_from(R&& in, const typename I::mask_type& mask,
                                  const I& indices, flags<Flags...> f = {});
```

5 Let:

(5.1) — `mask` be `typename I::mask_type(true)` for the overload with no `mask` parameter;

(5.2) — `T` be `typename V::value_type`.

6 *Constraints*: `ranges::range_value_t<R>` is a vectorizable type and satisfies *`explicitly-convertible-to`*`<T>`.

7 *Mandates*:

(7.1) — `ranges::range_value_t<R>` is a vectorizable type,

(7.2) — `same_as<remove_cvref_t<V>, V>` is `true`,

(7.3) — `V` is an enabled specialization of `basic_vec`,

(7.4) — `V::size() == I::size()` is `true`, and

(7.5) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `ranges::range_value_t<R>` to `T` is value-preserving.

8 *Preconditions*:

(8.1) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(in)` points to storage aligned by `alignment_v<V, ranges::range_value_t<R>>`.

(8.2) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(in)` points to storage aligned by `N`.

9 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of

```
mask[i] && indices[i] < ranges::size(in) ? static_cast<T>(ranges::data(in)[indices[i]]) : T()
```

for all i in the range $[0, \texttt{I::size()})$.

10 *Remarks*: The default argument for template parameter `V` is `vec<ranges::range_value_t<R>, I::size()>`.

```
template<simd-vec-type V, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr void unchecked_scatter_to(const V& v, R&& out, const I& indices,
                                      flags<Flags...> f = {});
template<simd-vec-type V, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr void unchecked_scatter_to(const V& v, R&& out, const typename I::mask_type& mask,
                                      const I& indices, flags<Flags...> f = {});
```

11 Let `mask` be `typename I::mask_type(true)` for the overload with no `mask` parameter.

12 *Preconditions*: All values in `select(mask, indices, typename I::value_type())` are in the range $[0, \texttt{ranges::size(out)})$.

13 *Effects*: Equivalent to: `partial_scatter_to(v, out, mask, indices, f);`

```
template<simd-vec-type V, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr void
  partial_scatter_to(const V& v, R&& out, const I& indices, flags<Flags...> f = {});
template<simd-vec-type V, ranges::contiguous_range R, simd-integral I, class... Flags>
  requires ranges::sized_range<R>
  constexpr void partial_scatter_to(const V& v, R&& out, const typename I::mask_type& mask,
                                    const I& indices, flags<Flags...> f = {});
```

14 Let `mask` be `typename I::mask_type(true)` for the overload with no `mask` parameter.

15 *Constraints*:

(15.1) — `V::size() == I::size()` is `true`,

(15.2) — `ranges::iterator_t<R>` models `indirectly_writable<ranges::range_value_t<R>>`, and

(15.3) — `typename V::value_type` satisfies *`explicitly-convertible-to`*`<ranges::range_value_t<R>>`.

16 *Mandates*:

(16.1) — `ranges::range_value_t<R>` is a vectorizable type, and

(16.2) — if the template parameter pack `Flags` does not contain *`convert-flag`*, then the conversion from `typename V::value_type` to `ranges::range_value_t<R>` is value-preserving.

©ISO/IEC

17 *Preconditions*:

(17.1) — For all selected indices i the values `indices[`i`]` are unique.

(17.2) — If the template parameter pack `Flags` contains *`aligned-flag`*, `ranges::data(out)` points to storage aligned by `alignment_v<V, ranges::range_value_t<R>>`.

(17.3) — If the template parameter pack `Flags` contains *`overaligned-flag`*`<N>`, `ranges::data(out)` points to storage aligned by `N`.

18 *Effects*: For all i in the range $[0, \texttt{I::size()})$, if `mask[`i`] && (indices[`i`] < ranges::size(out))` is `true`, evaluates `ranges::data(out)[indices[`i`]] = static_cast<ranges::range_value_t<R>>(v[`i`])`.

29.10.8.11 Creation [simd.creation]

```
template<class T, class Abi>
  constexpr auto chunk(const basic_vec<typename T::value_type, Abi>& x) noexcept;
template<class T, class Abi>
  constexpr auto chunk(const basic_mask<mask-element-size<T>, Abi>& x) noexcept;
```

1 *Constraints*:

(1.1) — For the first overload, `T` is an enabled specialization of `basic_vec`. If `basic_vec<typename T::value_type, Abi>::size() % T::size()` is not `0`, then `resize_t<basic_vec<typename T::value_type, Abi>::size() % T::size(), T>` is valid and denotes a type.

(1.2) — For the second overload, `T` is an enabled specialization of `basic_mask`. If `basic_mask<`*`mask-element-size`*`<T>, Abi>::size() % T::size()` is not `0`, then `resize_t<basic_mask<`*`mask-element-size`*`<T>, Abi>::size() % T::size(), T>` is valid and denotes a type.

2 Let N be `x.size() / T::size()`.

3 *Returns*:

(3.1) — If `x.size() % T::size() == 0` is `true`, an `array<T,` N`>` with the i^{th} `basic_vec` or `basic_mask` element of the j^{th} `array` element initialized to the value of the element in `x` with index i `+` j `* T::size()`.

(3.2) — Otherwise, a `tuple` of N objects of type `T` and one object of type `resize_t<x.size() % T::size(), T>`. The i^{th} `basic_vec` or `basic_mask` element of the j^{th} `tuple` element of type `T` is initialized to the value of the element in `x` with index i `+` j `* T::size()`. The i^{th} `basic_vec` or `basic_mask` element of the N^{th} `tuple` element is initialized to the value of the element in `x` with index i `+` N `* T::size()`.

```
template<simd-size-type N, class T, class Abi>
  constexpr auto chunk(const basic_vec<T, Abi>& x) noexcept;
```

4 *Effects*: Equivalent to: `return chunk<resize_t<N, basic_vec<T, Abi>>>(x);`

```
template<simd-size-type N, size_t Bytes, class Abi>
  constexpr auto chunk(const basic_mask<Bytes, Abi>& x) noexcept;
```

5 *Effects*: Equivalent to: `return chunk<resize_t<N, basic_mask<Bytes, Abi>>>(x);`

```
template<class T, class... Abis>
  constexpr resize_t<(basic_vec<T, Abis>::size() + ...),
    basic_vec<T, Abis...[0]>> cat(const basic_vec<T, Abis>&... xs) noexcept;
template<size_t Bytes, class... Abis>
  constexpr resize_t<(basic_mask<Bytes, Abis>::size() + ...),
    basic_mask<Bytes, Abis...[0]>> cat(const basic_mask<Bytes, Abis>&... xs) noexcept;
```

6 *Returns*: A data-parallel object initialized with the concatenated values in the `xs` pack of data-parallel objects: The i^{th} `basic_vec`/`basic_mask` element of the j^{th} parameter in the `xs` pack is copied to the return value's element with index i + the sum of the width of the first j parameters in the `xs` pack.

29.10.8.12 Algorithms [simd.alg]

```
template<class T, class Abi>
  constexpr basic_vec<T, Abi> min(const basic_vec<T, Abi>& a,
                                  const basic_vec<T, Abi>& b) noexcept;
```

1 *Constraints*: `T` models `totally_ordered`.

2 *Returns*: The result of the element-wise application of `min(a[`i`], b[`i`])` for all i in the range of $[0, $`basic_vec<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr basic_vec<T, Abi> max(const basic_vec<T, Abi>& a,
                                  const basic_vec<T, Abi>& b) noexcept;
```

3 *Constraints*: `T` models `totally_ordered`.

4 *Returns*: The result of the element-wise application of `max(a[`i`], b[`i`])` for all i in the range of $[0, $`basic_vec<T, Abi>::size()`$)$.

```
template<class T, class Abi>
  constexpr pair<basic_vec<T, Abi>, basic_vec<T, Abi>>
    minmax(const basic_vec<T, Abi>& a, const basic_vec<T, Abi>& b) noexcept;
```

5 *Effects*: Equivalent to: `return pair{min(a, b), max(a, b)};`

```
template<class T, class Abi>
  constexpr basic_vec<T, Abi> clamp(
    const basic_vec<T, Abi>& v, const basic_vec<T, Abi>& lo, const basic_vec<T, Abi>& hi);
```

6 *Constraints*: `T` models `totally_ordered`.

7 *Preconditions*: No element in `lo` is greater than the corresponding element in `hi`.

8 *Returns*: The result of element-wise application of `clamp(v[`i`], lo[`i`], hi[`i`])` for all i in the range of $[0, $`basic_vec<T, Abi>::size()`$)$.

```
template<class T, class U>
  constexpr auto select(bool c, const T& a, const U& b)
  -> remove_cvref_t<decltype(c ? a : b)>;
```

9 *Effects*: Equivalent to: `return c ? a : b;`

```
template<size_t Bytes, class Abi, class T, class U>
  constexpr auto select(const basic_mask<Bytes, Abi>& c, const T& a, const U& b)
  noexcept -> decltype(simd-select-impl(c, a, b));
```

10 *Effects*: Equivalent to:

```
return simd-select-impl(c, a, b);
```

where *`simd-select-impl`* is found by argument-dependent lookup (6.5.4) contrary to 16.4.2.2.

1 Let `Ret` denote the return type of the specialization of a function template with the name *math-func*. Let *math-func-vec* denote:

```
template<class... Args>
Ret math-func-vec(const Args&... args) {
  return Ret([&](simd-size-type i) {
    return math-func(deduced-vec-t<V>(args)[i]...);
  });
}
```

2 *Returns*: A value `ret` of type `Ret`, that is element-wise equal to the result of calling *math-func-vec* with the parameters of the above functions. If in an invocation of a scalar overload of *math-func* for index `i` in *math-func-vec* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

3 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<math-floating-point V>
  constexpr deduced-vec-t<V> ldexp(const V& x, const rebind_t<int, deduced-vec-t<V>>& exp);
template<math-floating-point V>
  constexpr deduced-vec-t<V> scalbn(const V& x, const rebind_t<int, deduced-vec-t<V>>& n);
template<math-floating-point V>
  constexpr deduced-vec-t<V>
    scalbln(const V& x, const rebind_t<long int, deduced-vec-t<V>>& n);
```

4 Let `Ret` be *deduced-vec-t*`<V>`. Let *math-func* denote the name of the function template. Let *math-func-vec* denote:

```
Ret math-func-vec(const deduced-vec-t<V>& a, const auto& b) {
  return Ret([&](simd-size-type i) {
    return math-func(a[i], b[i]);
  });
}
```

5 *Returns*: A value `ret` of type `Ret`, that is element-wise equal to the result of calling *math-func-vec* with the parameters of the above functions. If in an invocation of a scalar overload of *math-func* for index `i` in *math-func-vec* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

6 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<signed_integral T, class Abi>
  constexpr basic_vec<T, Abi> abs(const basic_vec<T, Abi>& j);
```

7 *Preconditions*: `all_of(j >= -numeric_limits<T>::max())` is `true`.

8 *Returns*: An object where the i^{th} element is initialized to the result of `std::abs(j[`i`])` for all i in the range $[0, \texttt{j.size()})$.

template<math-floating-point V>
  constexpr deduced-vec-t<V>
    remquo(const V& x, const deduced-vec-t<V>& y, rebind_t<int, deduced-vec-t<V>>* quo);
```

19 Let `V0` be *`deduced-vec-t`*`<V>`. Let *`remquo-vec`* denote:

```
pair<V0, rebind_t<int, V0>> remquo-vec(const V0& x, const V0& y) {
  int r1[V0::size()];
  V0 r0([&](simd-size-type i) { return remquo(x[i], y[i], &r1[i]); });
  return {r0, rebind_t<int, V0>(r1)};
}
```

Let `ret` be a value of type `pair<V0, rebind_t<int, V0>>` that is the same value as the result of calling *`remquo-vec`*`(x, y)`. If in an invocation of a scalar overload of `remquo` for index `i` in *`remquo-vec`* a domain, pole, or range error would occur, the value of `ret[i]` is unspecified.

20 *Effects*: Sets `*quo` to `ret.second`.

21 *Returns*: `ret.first`.

22 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<class T, class Abi>
  constexpr basic_vec<T, Abi> modf(const type_identity_t<basic_vec<T, Abi>>& value,
                                   basic_vec<T, Abi>* iptr);
```

23 Let `V` be `basic_vec<T, Abi>`. Let *`modf-vec`* denote:

```
pair<V, V> modf-vec(const V& x) {
  T r1[Ret::size()];
  V r0([&](simd-size-type i) {
    return modf(V(x)[i], &r1[i]);
  });
  return {r0, V(r1)};
}
```

Let `ret` be a value of type `pair<V, V>` that is the same value as the result of calling *`modf-vec`*`(value)`.

24 *Effects*: Sets `*iptr` to `ret.second`.

25 *Returns*: `ret.first`.

29.10.8.14 Bit manipulation [simd.bit]

```
template<simd-vec-type V> constexpr V byteswap(const V& v) noexcept;
```

1 *Constraints*: The type `V::value_type` models `integral`.

2 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of `std::byteswap(v[`i`])` for all i in the range $[0, \texttt{V::size()})$.

```
template<simd-vec-type V> constexpr V bit_ceil(const V& v);
```

3 *Constraints*: The type `V::value_type` is an unsigned integer type (6.9.2).

4 *Preconditions*: For every i in the range $[0, \texttt{V::size()})$, the smallest power of 2 greater than or equal to `v[`i`]` is representable as a value of type `V::value_type`.

5 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of `std::bit_ceil(v[`i`])` for all i in the range $[0, \texttt{V::size()})$.

6 *Remarks*: A function call expression that violates the precondition in the *Preconditions*: element is not a core constant expression (7.7.2).

```
template<simd-vec-type V> constexpr V bit_floor(const V& v) noexcept;
```

7 *Constraints*: The type `V::value_type` is an unsigned integer type (6.9.2).

8 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of `std::bit_floor(v[`i`])` for all i in the range $[0, \texttt{V::size()})$.

```
template<simd-vec-type V>
  constexpr typename V::mask_type has_single_bit(const V& v) noexcept;
```

9 *Constraints*: The type `V::value_type` is an unsigned integer type (6.9.2).

10 *Returns*: A `basic_mask` object where the i^{th} element is initialized to the result of `std::has_single_bit(v[`i`])` for all i in the range $[0, \texttt{V::size()})$.

```
template<simd-vec-type V0, simd-vec-type V1>

template<simd-vec-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countr_zero(const V& v) noexcept;
template<simd-vec-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> countr_one(const V& v) noexcept;
template<simd-vec-type V>
  constexpr rebind_t<make_signed_t<typename V::value_type>, V> popcount(const V& v) noexcept;
```

15 *Constraints*: The type `V::value_type` is an unsigned integer type (6.9.2).

16 *Returns*: A `basic_vec` object where the i^{th} element is initialized to the result of *bit-func*`(v[`i`])` for all i in the range $[0, \texttt{V::size()})$, where *bit-func* is the corresponding scalar function from `<bit>`.

29.10.8.15 Complex math [simd.complex.math]

```
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> real(const V&) noexcept;
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> imag(const V&) noexcept;

template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> abs(const V&);
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> arg(const V&);
template<simd-complex V>
  constexpr rebind_t<simd-complex-value-type<V>, V> norm(const V&);
template<simd-complex V> constexpr V conj(const V&);
template<simd-complex V> constexpr V proj(const V&);

template<simd-complex V> constexpr V exp(const V& v);
template<simd-complex V> constexpr V log(const V& v);
template<simd-complex V> constexpr V log10(const V& v);

template<simd-complex V> constexpr V sqrt(const V& v);
template<simd-complex V> constexpr V sin(const V& v);
template<simd-complex V> constexpr V asin(const V& v);
template<simd-complex V> constexpr V cos(const V& v);
template<simd-complex V> constexpr V acos(const V& v);
template<simd-complex V> constexpr V tan(const V& v);
template<simd-complex V> constexpr V atan(const V& v);
template<simd-complex V> constexpr V sinh(const V& v);
template<simd-complex V> constexpr V asinh(const V& v);
template<simd-complex V> constexpr V cosh(const V& v);
template<simd-complex V> constexpr V acosh(const V& v);
template<simd-complex V> constexpr V tanh(const V& v);
template<simd-complex V> constexpr V atanh(const V& v);
```

1 *Returns*: A `basic_vec` object `ret` where the i^{th} element is initialized to the result of *cmplx-func*`(v[`i`])` for all i in the range $[0, \texttt{V::size()})$, where *cmplx-func* is the corresponding function from `<complex>`. If in an invocation of *cmplx-func* for index i a domain, pole, or range error would occur, the value of `ret[`i`]` is unspecified.

2 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

```
template<simd-floating-point V>
  rebind_t<complex<typename V::value_type>, V> polar(const V& x, const V& y = {});

template<simd-complex V> constexpr V pow(const V& x, const V& y);
```

3 *Returns*: A `basic_vec` object `ret` where the i^{th} element is initialized to the result of *cmplx-func*`(x[`i`], y[`i`])` for all i in the range $[0, \texttt{V::size()})$, where *cmplx-func* is the corresponding function from `<complex>`. If in an invocation of *cmplx-func* for index i a domain, pole, or range error would occur, the value of `ret[`i`]` is unspecified.

4 *Remarks*: It is unspecified whether `errno` (19.4) is accessed.

29.10.9 Class template `basic_mask` [simd.mask.class]

29.10.9.1 Overview [simd.mask.overview]

```
namespace std::simd {
  template<size_t Bytes, class Abi> class basic_mask {
  public:
    using value_type = bool;
    using abi_type = Abi;
    using iterator = simd-iterator<basic_mask>;
    using const_iterator = simd-iterator<const basic_mask>;

    constexpr iterator begin() noexcept { return {*this, 0}; }
    constexpr const_iterator begin() const noexcept { return {*this, 0}; }
```

```
constexpr const_iterator cbegin() const noexcept { return {*this, 0}; }
constexpr default_sentinel_t end() const noexcept { return {}; }
constexpr default_sentinel_t cend() const noexcept { return {}; }

static constexpr integral_constant<simd-size-type, mask-size-v<Bytes, Abi>> size {};

constexpr basic_mask() noexcept = default;

// 29.10.9.2, basic_mask constructors
constexpr explicit basic_mask(same_as<value_type> auto) noexcept;
template<size_t UBytes, class UAbi>
  constexpr explicit basic_mask(const basic_mask<UBytes, UAbi>&) noexcept;
template<class G>
  constexpr explicit basic_mask(G&& gen);
template<same_as<bitset<size()>> T>
  constexpr basic_mask(const T& b) noexcept;
template<unsigned_integral T>
  requires (!same_as<T, value_type>)
  constexpr explicit basic_mask(T val) noexcept;

// 29.10.9.3, basic_mask subscript operators
constexpr value_type operator[](simd-size-type) const;
template<simd-integral I>
  constexpr resize_t<I::size(), basic_mask> operator[](const I& indices) const;

// 29.10.9.4, basic_mask unary operators

```

```
    friend constexpr basic_mask
      operator<=(const basic_mask&, const basic_mask&) noexcept;
    friend constexpr basic_mask
      operator>(const basic_mask&, const basic_mask&) noexcept;
    friend constexpr basic_mask
      operator<(const basic_mask&, const basic_mask&) noexcept;

    // 29.10.10.4, basic_mask exposition only conditional operators
    friend constexpr basic_mask simd-select-impl( // exposition only
      const basic_mask&, const basic_mask&, const basic_mask&) noexcept;
    friend constexpr basic_mask simd-select-impl( // exposition only
      const basic_mask&, same_as<bool> auto, same_as<bool> auto) noexcept;
    template<class T0, class T1>
      friend constexpr vec<see below, size()>
        simd-select-impl(const basic_mask&, const T0&, const T1&) noexcept; // exposition only
  };
}
```

1 Every specialization of `basic_mask` is a complete type. The specialization of `basic_mask<Bytes, Abi>` is:

(1.1) — disabled, if there is no vectorizable type `T` such that `Bytes` is equal to `sizeof(T)`,

(1.2) — otherwise, enabled, if there exists a vectorizable type `T` and a value `N` in the range $[1, 64]$ such that `Bytes` is equal to `sizeof(T)` and `Abi` names the ABI tag denoted by *`decude-abi-t`*`<T, N>`,

(1.3) — otherwise, it is implementation-defined if such a specialization is enabled.

If `basic_mask<Bytes, Abi>` is disabled, the specialization has a deleted default constructor, deleted destructor, deleted copy constructor, and deleted copy assignment. In addition only the `value_type` and `abi_type` members are present.

If `basic_mask<Bytes, Abi>` is enabled, `basic_mask<Bytes, Abi>` is trivially copyable.

2 *Recommended practice*: Implementations should support implicit conversions between specializations of `basic_mask` and appropriate implementation-defined types.

[*Note 1*: Appropriate types are non-standard vector types which are available in the implementation. — *end note*]

29.10.9.2 Constructors [simd.mask.ctor]

```
constexpr explicit basic_mask(same_as<value_type> auto) noexcept;
```

1 *Effects*: Initializes each element with `x`.

```
template<size_t UBytes, class UAbi>
  constexpr explicit basic_mask(const basic_mask<UBytes, UAbi>& x) noexcept;
```

2 *Constraints*: `basic_mask<UBytes, UAbi>::size() == size()` is `true`.

3 *Effects*: Initializes the i^{th} element with `x[`i`]` for all i in the range of $[0, \texttt{size()})$.

```
template<class G> constexpr explicit basic_mask(G&& gen);
```

4 *Constraints*: The expression `gen(integral_constant<`*`simd-size-type`*`, i>())` is well-formed and its type is `bool` for all i in the range of $[0, \texttt{size()})$.

5 *Effects*: Initializes the i^{th} element with `gen(integral_constant<`*`simd-size-type`*`, i>())` for all i in the range of $[0, \texttt{size()})$.

6 *Remarks*: `gen` is invoked exactly once for each i, in increasing order of i.

```
template<same_as<bitset<size()>> T>
  constexpr basic_mask(const T& b) noexcept;
```

7 *Effects*: Initializes the i^{th} element with `b[`i`]` for all i in the range $[0, \texttt{size()})$.

```
template<unsigned_integral T>
  requires (!same_as<T, value_type>)
  constexpr explicit basic_mask(T val) noexcept;
```

8 *Effects*: Initializes the first M elements to the corresponding bit values in `val`, where M is the smaller of `size()` and the number of bits in the value representation (6.9.1) of the type of `val`. If M is less than `size()`, the remaining elements are initialized to zero.

29.10.9.3 Subscript operator [simd.mask.subscr]

```
constexpr value_type operator[](simd-size-type i) const;
```

1 *Preconditions*: `i >= 0 && i < size()` is `true`.

2 *Returns*: The value of the i^{th} element.

3 *Throws*: Nothing.

```
template<simd-integral I>
  constexpr resize_t<I::size(), basic_mask> operator[](const I& indices) const;
```

4 *Effects*: Equivalent to: `return permute(*this, indices);`

29.10.9.4 Unary operators [simd.mask.unary]

```
constexpr basic_mask operator!() const noexcept;
constexpr see below operator+() const noexcept;
constexpr see below operator-() const noexcept;
constexpr see below operator~() const noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A data-parallel object where the i^{th} element is initialized to the results of applying *op* to `operator[](`i`)` for all i in the range of $[0, \texttt{size()})$.

3 *Remarks*: If there exists a vectorizable signed integer type `I` such that `sizeof(I) == Bytes` is `true`, `operator+`, `operator-`, and `operator ~` return an enabled specialization `R` of `basic_vec` such that `R::value_type` denotes *integer-from*`<Bytes>` and `R::size() == size()` is `true`. Otherwise, these operators are defined as deleted and their return types are unspecified.

29.10.9.5 Conversions [simd.mask.conv]

```
template<class U, class A>
  constexpr explicit(sizeof(U) != Bytes) operator basic_vec<U, A>() const noexcept;
```

1 *Constraints*: *simd-size-v*`<U, A> == `*simd-size-v*`<T, Abi>`.

2 *Returns*: A data-parallel object where the i^{th} element is initialized to `static_cast<U>(operator[](`i`))`.

```
constexpr bitset<size()> to_bitset() const noexcept;
```

3 *Returns*: A `bitset<size()>` object where the i^{th} element is initialized to `operator[](`i`)` for all i in the range $[0, \texttt{size()})$.

```
constexpr unsigned long long to_ullong() const;
```

4 Let N be the width of `unsigned long long`.

5 *Preconditions*:

(5.1) — `size() <=` N is `true`, or

(5.2) — for all i in the range $[N, \texttt{size()})$, `operator[](`i`)` returns `false`.

6 *Returns*: The integral value corresponding to the bits in `*this`.

7 *Throws*: Nothing.

29.10.10 `basic_mask` non-member operations [simd.mask.nonmembers]

29.10.10.1 Binary operators [simd.mask.binary]

```
friend constexpr basic_mask
  operator&&(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator||(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator& (const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator| (const basic_mask& lhs, const basic_mask& rhs) noexcept;
```

©ISO/IEC

```
friend constexpr basic_mask
  operator^ (const basic_mask& lhs, const basic_mask& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A `basic_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.10.2 Compound assignment [simd.mask.cassign]

```
friend constexpr basic_mask&
  operator&=(basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask&
  operator|=(basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask&
  operator^=(basic_mask& lhs, const basic_mask& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Effects*: These operators apply *op* to `lhs` and `rhs` as a binary element-wise operation.

3 *Returns*: `lhs`.

29.10.10.3 Comparisons [simd.mask.comparison]

```
friend constexpr basic_mask
  operator==(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator!=(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator>=(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator<=(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator>(const basic_mask& lhs, const basic_mask& rhs) noexcept;
friend constexpr basic_mask
  operator<(const basic_mask& lhs, const basic_mask& rhs) noexcept;
```

1 Let *op* be the operator.

2 *Returns*: A `basic_mask` object initialized with the results of applying *op* to `lhs` and `rhs` as a binary element-wise operation.

29.10.10.4 Exposition-only conditional operators [simd.mask.cond]

```
friend constexpr basic_mask simd-select-impl(
  const basic_mask& mask, const basic_mask& a, const basic_mask& b) noexcept;
```

1 *Returns*: A `basic_mask` object where the i^{th} element equals `mask[`i`] ? a[`i`] : b[`i`]` for all i in the range of $[0, \texttt{size()})$.

```
friend constexpr basic_mask
simd-select-impl(const basic_mask& mask, same_as<bool> auto a, same_as<bool> auto b) noexcept;
```

2 *Returns*: A `basic_mask` object where the i^{th} element equals `mask[`i`] ? a : b` for all i in the range of $[0, \texttt{size()})$.

```
template<class T0, class T1>
  friend constexpr vec<see below, size()>
    simd-select-impl(const basic_mask& mask, const T0& a, const T1& b) noexcept;
```

3 *Constraints*:

(3.1) — `same_as<T0, T1>` is `true`,

(3.2) — `T0` is a vectorizable type, and

(3.3) — `sizeof(T0) == Bytes`.

4 *Returns*: A `vec<T0, size()>` object where the i^{th} element equals `mask[`i`] ? a : b` for all i in the range of $[0, \texttt{size()})$.

29.10.10.5 Reductions [simd.mask.reductions]

```
template<size_t Bytes, class Abi>
  constexpr bool all_of(const basic_mask<Bytes, Abi>& k) noexcept;
```

1 *Returns*: `true` if all boolean elements in `k` are `true`, otherwise `false`.

```
template<size_t Bytes, class Abi>
  constexpr bool any_of(const basic_mask<Bytes, Abi>& k) noexcept;
```

2 *Returns*: `true` if at least one boolean element in `k` is `true`, otherwise `false`.

```
template<size_t Bytes, class Abi>
  constexpr bool none_of(const basic_mask<Bytes, Abi>& k) noexcept;
```

3 *Returns*: `!any_of(k)`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_count(const basic_mask<Bytes, Abi>& k) noexcept;
```

4 *Returns*: The number of boolean elements in `k` that are `true`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_min_index(const basic_mask<Bytes, Abi>& k);
```

5 *Preconditions*: `any_of(k)` is `true`.

6 *Returns*: The lowest element index i where `k[`i`]` is `true`.

```
template<size_t Bytes, class Abi>
  constexpr simd-size-type reduce_max_index(const basic_mask<Bytes, Abi>& k);
```

7 *Preconditions*: `any_of(k)` is `true`.

8 *Returns*: The greatest element index i where `k[`i`]` is `true`.

```
constexpr bool all_of(same_as<bool> auto x) noexcept;
constexpr bool any_of(same_as<bool> auto x) noexcept;
constexpr simd-size-type reduce_count(same_as<bool> auto x) noexcept;
```

9 *Returns*: `x`.

```
constexpr bool none_of(same_as<bool> auto x) noexcept;
```

10 *Returns*: `!x`.

```
constexpr simd-size-type reduce_min_index(same_as<bool> auto x);
constexpr simd-size-type reduce_max_index(same_as<bool> auto x);
```

11 *Preconditions*: `x` is `true`.

12 *Returns*: `0`.

29.11 C compatibility [numerics.c]

29.11.1 Header <stdckdint.h> synopsis [stdckdint.h.syn]

```
#define __STDC_VERSION_STDCKDINT_H__ 202311L

template<class type1, class type2, class type3>
  bool ckd_add(type1* result, type2 a, type3 b);
template<class type1, class type2, class type3>
  bool ckd_sub(type1* result, type2 a, type3 b);
template<class type1, class type2, class type3>
  bool ckd_mul(type1* result, type2 a, type3 b);
```

1 See also: ISO/IEC 9899:2024, 7.20

29.11.2 Checked integer operations [numerics.c.ckdint]

```
template<class type1, class type2, class type3>
  bool ckd_add(type1* result, type2 a, type3 b);
template<class type1, class type2, class type3>
  bool ckd_sub(type1* result, type2 a, type3 b);
```

```
template<class type1, class type2, class type3>
  bool ckd_mul(type1* result, type2 a, type3 b);
```

1 *Mandates*: Each of the types `type1`, `type2`, and `type3` is a signed or unsigned integer type (6.9.2).

2 *Remarks*: Each function template has the same semantics as the corresponding type-generic macro with the same name specified in See also: ISO/IEC 9899:2024, 7.20.

©ISO/IEC

30 Time library [time]

30.1 General [time.general]

1 This Clause describes the chrono library (30.2) and various C functions (30.15) that provide generally useful time utilities, as summarized in Table 130.

Table 130 — Time library summary [tab:time.summary]

	Subclause	Header
30.3	*Cpp17Clock* requirements	
30.4	Time-related traits	`<chrono>`
30.5	Class template `duration`	
30.6	Class template `time_point`	
30.7	Clocks	
30.8	Civil calendar	
30.9	Class template `hh_mm_ss`	
30.10	12/24 hour functions	
30.11	Time zones	
30.12	Formatting	
30.13	Parsing	
30.14	Hash support	
30.15	C library time utilities	`<ctime>`

30.2 Header <chrono> synopsis [time.syn]

```
#include <compare>              // see 17.12.1

30.3 *Cpp17Clock* requirements [time.clock.req]

1 A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock's `time_point` is referred to as the clock's *epoch*. A clock shall meet the requirements in Table 131.

2 In Table 131 `C1` and `C2` denote clock types. `t1` and `t2` are values returned by `C1::now()` where the call returning `t1` happens before (6.10.2) the call returning `t2` and both of these calls occur before `C1::time_point::max()`.

[*Note 1*: This means `C1` did not wrap around between `t1` and `t2`. — *end note*]

Table 131 — *Cpp17Clock* requirements [tab:time.clock]

Expression	Return type	Operational semantics
`C1::rep`	An arithmetic type or a class emulating an arithmetic type	The representation type of `C1::duration`.
`C1::period`	a specialization of `ratio`	The tick period of the clock in seconds.
`C1::duration`	`chrono::duration<C1::rep, C1::period>`	The `duration` type of the clock.

Table 131 — *Cpp17Clock* requirements (continued)

Expression	Return type	Operational semantics
`C1::time_point`	`chrono::time_point<C1>` or `chrono::time_point<C2, C1::duration>`	The `time_point` type of the clock. `C1` and `C2` shall refer to the same epoch.
`C1::is_steady`	`const bool`	`true` if `t1 <= t2` is always `true` and the time between clock ticks is constant, otherwise `false`.
`C1::now()`	`C1::time_point`	Returns a `time_point` object representing the current point in time.

3 [*Note 2*: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — *end note*]

4 A type `TC` meets the *Cpp17TrivialClock* requirements if

(4.1) — `TC` meets the *Cpp17Clock* requirements,

(4.2) — the types `TC::rep`, `TC::duration`, and `TC::time_point` meet the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) and *Cpp17Swappable* (16.4.4.3) requirements and the requirements of numeric types (29.2),

[*Note 3*: This means, in particular, that operations on these types will not throw exceptions. — *end note*]

(4.3) — the function `TC::now()` does not throw exceptions, and

(4.4) — the type `TC::time_point::clock` meets the *Cpp17TrivialClock* requirements, recursively.

30.4 Time-related traits [time.traits]

30.4.1 `treat_as_floating_point` [time.traits.is.fp]

```
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

1 The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick `period`. If `treat_as_floating_point_v<Rep>` is `true`, then implicit conversions are allowed among `durations`. Otherwise, the implicit convertibility depends on the tick `periods` of the `durations`.

[*Note 1*: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is `false`, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — *end note*]

30.4.2 `duration_values` [time.traits.duration.values]

```
template<class Rep>
struct duration_values {
public:
  static constexpr Rep zero() noexcept;
  static constexpr Rep min() noexcept;
  static constexpr Rep max() noexcept;
};
```

1 The `duration` template uses the `duration_values` trait to construct special values of the duration's representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```
static constexpr Rep zero() noexcept;
```

2 *Returns*: `Rep(0)`.

[*Note 1*: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — *end note*]

3 *Remarks*: The value returned shall be the additive identity.

```
static constexpr Rep min() noexcept;
```

4 *Returns*: `numeric_limits<Rep>::lowest()`.

5 *Remarks*: The value returned shall compare less than or equal to `zero()`.

```
static constexpr Rep max() noexcept;
```

6 *Returns*: `numeric_limits<Rep>::max()`.

7 *Remarks*: The value returned shall compare greater than `zero()`.

30.4.3 Specializations of `common_type` [time.traits.specializations]

```
template<class Rep1, class Period1, class Rep2, class Period2>
  struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
  };
```

1 The `period` of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[*Note 1*: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — *end note*]

2 [*Note 2*: The `typedef` name `type` is a synonym for the `duration` with the largest tick `period` possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — *end note*]

```
template<class Clock, class Duration1, class Duration2>
  struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
  };
```

3 The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two `duration`s.

30.4.4 Class template `is_clock` [time.traits.is.clock]

```
template<class T> struct is_clock;
```

1 `is_clock` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` meets the *Cpp17Clock* requirements (30.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the *Cpp17Clock* requirements is unspecified, except that as a minimum a type `T` shall not qualify as a *Cpp17Clock* unless it meets all of the following conditions:

(1.1) — the *qualified-id*s `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),

(1.2) — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),

(1.3) — the expression `T::now()` is well-formed when treated as an unevaluated operand.

2 The behavior of a program that adds specializations for `is_clock` is undefined.

30.5 Class template `duration` [time.duration]

30.5.1 General [time.duration.general]

1 A `duration` type measures time between two points in time (`time_point`s). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```
namespace std::chrono {
  template<class Rep, class Period = ratio<1>>
  class duration {
  public:
    using rep    = Rep;
    using period = Period::type;
```

```
  private:
    rep rep_;       // exposition only

  public:
    // 30.5.2, construct/copy/destroy
    constexpr duration() = default;
    template<class Rep2>
      constexpr explicit duration(const Rep2& r);
    template<class Rep2, class Period2>
      constexpr duration(const duration<Rep2, Period2>& d);
    ~duration() = default;
    duration(const duration&) = default;
    duration& operator=(const duration&) = default;

    // 30.5.3, observer
    constexpr rep count() const;

    // 30.5.4, arithmetic
    constexpr common_type_t<duration> operator+() const;
    constexpr common_type_t<duration> operator-() const;
    constexpr duration& operator++();
    constexpr duration  operator++(int);
    constexpr duration& operator--();
    constexpr duration  operator--(int);

    constexpr duration& operator+=(const duration& d);
    constexpr duration& operator-=(const duration& d);

    constexpr duration& operator*=(const rep& rhs);
    constexpr duration& operator/=(const rep& rhs);
    constexpr duration& operator%=(const rep& rhs);
    constexpr duration& operator%=(const duration& rhs);

    // 30.5.5, special values
    static constexpr duration zero() noexcept;
    static constexpr duration min() noexcept;
    static constexpr duration max() noexcept;
  };
}
```

2 `Rep` shall be an arithmetic type or a class emulating an arithmetic type. If a specialization of `duration` is instantiated with a cv-qualified type or a specialization of `duration` as the argument for the template parameter `Rep`, the program is ill-formed.

3 If `Period` is not a specialization of `ratio`, the program is ill-formed. If `Period::num` is not positive, the program is ill-formed.

4 Members of `duration` do not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of `duration` shall be a constexpr function if and only if the required initialization of the member *`rep_`* for copy and move, respectively, would be constexpr-suitable (9.2.6).

6 [*Example 1*:

```
duration<long, ratio<60>> d0;       // holds a count of minutes using a long
duration<long long, milli> d1;      // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>>  d2; // holds a count with a tick period of 1/30 of a second
                                    // (30 Hz) using a double
```

— *end example*]

30.5.2 Constructors [time.duration.cons]

```
template<class Rep2>
  constexpr explicit duration(const Rep2& r);
```

1 *Constraints*: `is_convertible_v<const Rep2&, rep>` is `true` and

©ISO/IEC

(1.1) — `treat_as_floating_point_v<rep>` is `true` or

(1.2) — `treat_as_floating_point_v<Rep2>` is `false`.

[*Example 1*:

```
duration<int, milli> d(3);          // OK
duration<int, milli> d2(3.5);       // error
```

— *end example*]

2 *Effects*: Initializes *rep_* with `r`.

```
template<class Rep2, class Period2>
  constexpr duration(const duration<Rep2, Period2>& d);
```

3 *Constraints*: `is_convertible_v<const Rep2&, rep>` is `true`. `ratio_divide<typename Period2::type, period>` is a valid ratio specialization. Either:

(3.1) — `treat_as_floating_point_v<rep>` is `true`; or

(3.2) — `ratio_divide<Period2, period>::den` is `1` and `treat_as_floating_point_v<Rep2>` is `false`.

[*Note 1*: This requirement prevents implicit truncation errors when converting between integral-based `duration` types. Such a construction could easily lead to confusion about the value of the `duration`. — *end note*]

[*Example 2*:

```
duration<int, milli> ms(3);
duration<int, micro> us = ms;       // OK
duration<int, milli> ms2 = us;      // error
```

— *end example*]

4 *Effects*: Initializes *rep_* with `duration_cast<duration>(d).count()`.

30.5.3 Observer [time.duration.observer]

```
constexpr rep count() const;
```

1 *Returns*: *rep_*.

30.5.4 Arithmetic [time.duration.arithmetic]

```
constexpr common_type_t<duration> operator+() const;
```

1 *Returns*: `common_type_t<duration>(*this)`.

```
constexpr common_type_t<duration> operator-() const;
```

2 *Returns*: `common_type_t<duration>(-`*rep_*`)`.

```
constexpr duration& operator++();
```

3 *Effects*: Equivalent to: `++`*rep_*.

4 *Returns*: `*this`.

```
constexpr duration operator++(int);
```

5 *Effects*: Equivalent to: `return duration(`*rep_*`++);`

```
constexpr duration& operator--();
```

6 *Effects*: Equivalent to: `--`*rep_*.

7 *Returns*: `*this`.

```
constexpr duration operator--(int);
```

8 *Effects*: Equivalent to: `return duration(`*rep_*`--);`

```
constexpr duration& operator+=(const duration& d);
```

9 *Effects*: Equivalent to: *rep_* `+= d.count()`.

10 *Returns*: `*this`.

```
constexpr duration& operator-=(const duration& d);
```

11 *Effects*: Equivalent to: `rep_ -= d.count()`.

12 *Returns*: `*this`.

```
constexpr duration& operator*=(const rep& rhs);
```

13 *Effects*: Equivalent to: `rep_ *= rhs`.

14 *Returns*: `*this`.

```
constexpr duration& operator/=(const rep& rhs);
```

15 *Effects*: Equivalent to: `rep_ /= rhs`.

16 *Returns*: `*this`.

```
constexpr duration& operator%=(const rep& rhs);
```

17 *Effects*: Equivalent to: `rep_ %= rhs`.

18 *Returns*: `*this`.

```
constexpr duration& operator%=(const duration& rhs);
```

19 *Effects*: Equivalent to: `rep_ %= rhs.count()`.

20 *Returns*: `*this`.

30.5.5 Special values [time.duration.special]

```
static constexpr duration zero() noexcept;
```

1 *Returns*: `duration(duration_values<rep>::zero())`.

```
static constexpr duration min() noexcept;
```

2 *Returns*: `duration(duration_values<rep>::min())`.

```
static constexpr duration max() noexcept;
```

3 *Returns*: `duration(duration_values<rep>::max())`.

30.5.6 Non-member arithmetic [time.duration.nonmember]

1 In the function descriptions that follow, unless stated otherwise, let `CD` represent the return type of the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CD(CD(lhs).count() + CD(rhs).count())`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CD(CD(lhs).count() - CD(rhs).count())`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const duration<Rep1, Period>& d, const Rep2& s);
```

4 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true`.

5 *Returns*: `CD(CD(d).count() * s)`.

```
template<class Rep1, class Rep2, class Period>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator*(const Rep1& s, const duration<Rep2, Period>& d);
```

6 *Constraints*: `is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>>` is `true`.

7 *Returns*: `d * s`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator/(const duration<Rep1, Period>& d, const Rep2& s);
```

8 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

9 *Returns*: `CD(CD(d).count() / s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<Rep1, Rep2>
    operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

10 Let `CD` be `common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>`.

11 *Returns*: `CD(lhs).count() / CD(rhs).count()`.

```
template<class Rep1, class Period, class Rep2>
  constexpr duration<common_type_t<Rep1, Rep2>, Period>
    operator%(const duration<Rep1, Period>& d, const Rep2& s);
```

12 *Constraints*: `is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>>` is `true` and `Rep2` is not a specialization of `duration`.

13 *Returns*: `CD(CD(d).count() % s)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
    operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
```

14 *Returns*: `CD(CD(lhs).count() % CD(rhs).count())`.

30.5.7 Comparisons [time.duration.comparisons]

1 In the function descriptions that follow, `CT` represents `common_type_t<A, B>`, where `A` and `B` are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator==(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

2 *Returns*: `CT(lhs).count() == CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs).count() < CT(rhs).count()`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>(const duration<Rep1, Period1>& lhs,
                           const duration<Rep2, Period2>& rhs);
```

4 *Returns*: `rhs < lhs`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator<=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

5 *Returns*: `!(rhs < lhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  constexpr bool operator>=(const duration<Rep1, Period1>& lhs,
                            const duration<Rep2, Period2>& rhs);
```

6 *Returns*: `!(lhs < rhs)`.

```
template<class Rep1, class Period1, class Rep2, class Period2>
  requires three_way_comparable<typename CT::rep>
  constexpr auto operator<=>(const duration<Rep1, Period1>& lhs,
                             const duration<Rep2, Period2>& rhs);
```

7 *Returns*: `CT(lhs).count() <=> CT(rhs).count()`.

30.5.8 Conversions [time.duration.cast]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*: Let `CF` be `ratio_divide<Period, typename ToDuration::period>`, and `CR` be `common_type<typename ToDuration::rep, Rep, intmax_t>::type`.

(2.1) — If `CF::num == 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
```

(2.2) — otherwise, if `CF::num != 1` and `CF::den == 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
```

(2.3) — otherwise, if `CF::num == 1` and `CF::den != 1`, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
```

(2.4) — otherwise, returns

```
ToDuration(static_cast<typename ToDuration::rep>(
  static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

3 [*Note 1*: This function does not use any implicit conversions; all conversions are done with `static_cast`. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — *end note*]

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration floor(const duration<Rep, Period>& d);
```

4 *Constraints*: `ToDuration` is a specialization of `duration`.

5 *Returns*: The greatest result `t` representable in `ToDuration` for which `t <= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration ceil(const duration<Rep, Period>& d);
```

6 *Constraints*: `ToDuration` is a specialization of `duration`.

7 *Returns*: The least result `t` representable in `ToDuration` for which `t >= d`.

```
template<class ToDuration, class Rep, class Period>
  constexpr ToDuration round(const duration<Rep, Period>& d);
```

8 *Constraints*: `ToDuration` is a specialization of `duration` and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

9 *Returns*: The value of `ToDuration` that is closest to `d`. If there are two closest values, then return the value `t` for which `t % 2 == 0`.

30.5.9 Suffixes for duration literals [time.duration.literals]

1 This subclause describes literal suffixes for constructing duration literals. The suffixes `h`, `min`, `s`, `ms`, `us`, `ns` denote duration values of the corresponding types `hours`, `minutes`, `seconds`, `milliseconds`, `microseconds`, and `nanoseconds` respectively if they are applied to *integer-literal*s.

2 If any of these suffixes are applied to a *floating-point-literal* the result is a `chrono::duration` literal with an unspecified floating-point representation.

3 If any of these suffixes are applied to an *integer-literal* and the resulting `chrono::duration` value cannot be represented in the result type because of overflow, the program is ill-formed.

4 [*Example 1*: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

— *end example*]

```
constexpr chrono::hours                                operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);
```

5 *Returns*: A `duration` literal representing `hours` hours.

```
constexpr chrono::minutes                              operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);
```

6 *Returns*: A `duration` literal representing `minutes` minutes.

```
constexpr chrono::seconds               operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);
```

7 *Returns*: A `duration` literal representing `sec` seconds.

8 [*Note 1*: The same suffix `s` is used for `basic_string` but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — *end note*]

```
constexpr chrono::milliseconds                 operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);
```

9 *Returns*: A `duration` literal representing `msec` milliseconds.

```
constexpr chrono::microseconds                 operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);
```

10 *Returns*: A `duration` literal representing `usec` microseconds.

```
constexpr chrono::nanoseconds                 operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);
```

11 *Returns*: A `duration` literal representing `nsec` nanoseconds.

30.5.10 Algorithms [time.duration.alg]

```
template<class Rep, class Period>
  constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

1 *Constraints*: `numeric_limits<Rep>::is_signed` is `true`.

2 *Returns*: If `d >= d.zero()`, return `d`, otherwise return `-d`.

30.5.11 I/O [time.duration.io]

```
template<class charT, class traits, class Rep, class Period>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1 *Effects*: Inserts the duration `d` onto the stream `os` as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where *units-suffix* depends on the type `Period::type` as follows:

(1.1) — If `Period::type` is `atto`, *units-suffix* is `"as"`.

(1.2) — Otherwise, if `Period::type` is `femto`, *units-suffix* is `"fs"`.

(1.3) — Otherwise, if `Period::type` is `pico`, *units-suffix* is `"ps"`.

(1.4) — Otherwise, if `Period::type` is `nano`, *units-suffix* is `"ns"`.

(1.5) — Otherwise, if `Period::type` is `micro`, it is implementation-defined whether *units-suffix* is `"µs"` (`"\u00b5\u0073"`) or `"us"`.

(1.6) — Otherwise, if `Period::type` is `milli`, *units-suffix* is `"ms"`.

(1.7) — Otherwise, if `Period::type` is `centi`, *units-suffix* is `"cs"`.

(1.8) — Otherwise, if `Period::type` is `deci`, *units-suffix* is `"ds"`.

(1.9) — Otherwise, if `Period::type` is `ratio<1>`, *units-suffix* is `"s"`.

(1.10) — Otherwise, if `Period::type` is `deca`, *units-suffix* is `"das"`.

(1.11) — Otherwise, if `Period::type` is `hecto`, *units-suffix* is `"hs"`.

(1.12) — Otherwise, if `Period::type` is `kilo`, *units-suffix* is `"ks"`.

(1.13) — Otherwise, if `Period::type` is `mega`, *units-suffix* is `"Ms"`.

(1.14) — Otherwise, if `Period::type` is `giga`, *units-suffix* is `"Gs"`.

(1.15) — Otherwise, if `Period::type` is `tera`, *units-suffix* is `"Ts"`.

(1.16) — Otherwise, if `Period::type` is `peta`, *units-suffix* is `"Ps"`.

(1.17) — Otherwise, if `Period::type` is `exa`, *units-suffix* is `"Es"`.

(1.18) — Otherwise, if `Period::type` is `ratio<60>`, *units-suffix* is `"min"`.

(1.19) — Otherwise, if `Period::type` is `ratio<3600>`, *units-suffix* is `"h"`.

(1.20) — Otherwise, if `Period::type` is `ratio<86400>`, *units-suffix* is `"d"`.

(1.21) — Otherwise, if `Period::type::den == 1`, *units-suffix* is `"[`*num*`]s"`.

(1.22) — Otherwise, *units-suffix* is `"[`*num*`/`*den*`]s"`.

In the list above, the use of *num* and *den* refers to the static data members of `Period::type`, which are converted to arrays of `charT` using a decimal conversion with no leading zeroes.

2 *Returns*: `os`.

```
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                duration<Rep, Period>& d,
                basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the duration `d` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid duration, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

4 *Returns*: `is`.

30.6 Class template `time_point` [time.point]

30.6.1 General [time.point.general]

```
namespace std::chrono {
  template<class Clock, class Duration = typename Clock::duration>
  class time_point {
  public:
    using clock    = Clock;
    using duration = Duration;
    using rep      = duration::rep;
    using period   = duration::period;

  private:
    duration d_;                                          // exposition only

  public:
    // 30.6.2, construct
    constexpr time_point();                               // has value epoch
    constexpr explicit time_point(const duration& d);     // same as time_point() + d
    template<class Duration2>
      constexpr time_point(const time_point<clock, Duration2>& t);

    // 30.6.3, observer
    constexpr duration time_since_epoch() const;
```

```
    // 30.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 30.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
  };
}
```

1 If `Duration` is not a specialization of `duration`, the program is ill-formed.

30.6.2 Constructors [time.point.cons]

```
constexpr time_point();
```

1 *Effects*: Initializes `d_` with `duration::zero()`. Such a `time_point` object represents the epoch.

```
constexpr explicit time_point(const duration& d);
```

2 *Effects*: Initializes `d_` with `d`. Such a `time_point` object represents the epoch `+ d`.

```
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);
```

3 *Constraints*: `is_convertible_v<Duration2, duration>` is `true`.

4 *Effects*: Initializes `d_` with `t.time_since_epoch()`.

30.6.3 Observer [time.point.observer]

```
constexpr duration time_since_epoch() const;
```

1 *Returns*: `d_`.

30.6.4 Arithmetic [time.point.arithmetic]

```
constexpr time_point& operator++();
```

1 *Effects*: Equivalent to: `++d_`.

2 *Returns*: `*this`.

```
constexpr time_point operator++(int);
```

3 *Effects*: Equivalent to: `return time_point{d_++};`

```
constexpr time_point& operator--();
```

4 *Effects*: Equivalent to: `--d_`.

5 *Returns*: `*this`.

```
constexpr time_point operator--(int);
```

6 *Effects*: Equivalent to: `return time_point{d_--};`

```
constexpr time_point& operator+=(const duration& d);
```

7 *Effects*: Equivalent to: `d_ += d`.

8 *Returns*: `*this`.

```
constexpr time_point& operator-=(const duration& d);
```

9 *Effects*: Equivalent to: `d_ -= d`.

10 *Returns*: `*this`.

©ISO/IEC

30.6.5 Special values [time.point.special]

```
static constexpr time_point min() noexcept;
```

1 *Returns*: `time_point(duration::min())`.

```
static constexpr time_point max() noexcept;
```

2 *Returns*: `time_point(duration::max())`.

30.6.6 Non-member arithmetic [time.point.nonmember]

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

1 *Returns*: `CT(lhs.time_since_epoch() + rhs)`, where `CT` is the type of the return value.

```
template<class Rep1, class Period1, class Clock, class Duration2>
  constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
    operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `rhs + lhs`.

```
template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>
    operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
```

3 *Returns*: `CT(lhs.time_since_epoch() - rhs)`, where `CT` is the type of the return value.

```
template<class Clock, class Duration1, class Duration2>
  constexpr common_type_t<Duration1, Duration2>
    operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `lhs.time_since_epoch() - rhs.time_since_epoch()`.

30.6.7 Comparisons [time.point.comparisons]

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator==(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

1 *Returns*: `lhs.time_since_epoch() == rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

2 *Returns*: `lhs.time_since_epoch() < rhs.time_since_epoch()`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
                           const time_point<Clock, Duration2>& rhs);
```

3 *Returns*: `rhs < lhs`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

4 *Returns*: `!(rhs < lhs)`.

```
template<class Clock, class Duration1, class Duration2>
  constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
                            const time_point<Clock, Duration2>& rhs);
```

5 *Returns*: `!(lhs < rhs)`.

```
template<class Clock, class Duration1,
         three_way_comparable_with<Duration1> Duration2>
  constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,
                             const time_point<Clock, Duration2>& rhs);
```

6 *Returns*: `lhs.time_since_epoch() <=> rhs.time_since_epoch()`.

30.6.8 Conversions [time.point.cast]

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);
```

1 *Constraints*: `ToDuration` is a specialization of `duration`.

2 *Returns*:

```
time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))
```

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);
```

3 *Constraints*: `ToDuration` is a specialization of `duration`.

4 *Returns*: `time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);
```

5 *Constraints*: `ToDuration` is a specialization of `duration`.

6 *Returns*: `time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))`.

```
template<class ToDuration, class Clock, class Duration>
  constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);
```

7 *Constraints*: `ToDuration` is a specialization of `duration`, and `treat_as_floating_point_v<typename ToDuration::rep>` is `false`.

8 *Returns*: `time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))`.

30.7 Clocks [time.clock]

30.7.1 General [time.clock.general]

1 The types defined in 30.7 meet the *Cpp17TrivialClock* requirements (30.3) unless otherwise specified.

30.7.2 Class `system_clock` [time.clock.system]

30.7.2.1 Overview [time.clock.system.overview]

```
namespace std::chrono {
  class system_clock {
  public:
    using rep        = see below;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<system_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;

    // mapping to/from C type time_t
    static time_t     to_time_t  (const time_point& t) noexcept;
    static time_point from_time_t(time_t t) noexcept;
  };
}
```

1 Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as *Unix time*. This measure facilitates an efficient mapping between `sys_time` and calendar types (30.8).

[*Example 1*:
`sys_seconds{sys_days{1970y/January/1}}.time_since_epoch()` is `0s`.
`sys_seconds{sys_days{2000y/January/1}}.time_since_epoch()` is `946'684'800s`, which is `10'957 * 86'400s`.
— *end example*]

30.7.2.2 Members [time.clock.system.members]

```
using system_clock::rep = unspecified;
```

1 *Constraints*: `system_clock::duration::min() < system_clock::duration::zero()` is `true`.

[*Note 1*: This implies that `rep` is a signed type. — *end note*]

```
static time_t to_time_t(const time_point& t) noexcept;
```

2 *Returns*: A `time_t` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

```
static time_point from_time_t(time_t t) noexcept;
```

3 *Returns*: A `time_point` object that represents the same point in time as `t` when both values are restricted to the coarser of the precisions of `time_t` and `time_point`. It is implementation-defined whether values are rounded or truncated to the required precision.

30.7.2.3 Non-member functions [time.clock.system.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

1 *Constraints*: `treat_as_floating_point_v<typename Duration::rep>` is `false`, and `Duration{1} < days{1}` is `true`.

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);
```

3 [*Example 1*:

```
cout << sys_seconds{0s} << '\n';                // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';      // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';      // 2000-01-01 01:02:03
```

— *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

4 *Effects*: `os << year_month_day{dp}`.

5 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

6 *Effects*: Attempts to parse the input stream `is` into the `sys_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

7 *Returns*: `is`.

30.7.3 Class `utc_clock` [time.clock.utc]

30.7.3.1 Overview [time.clock.utc.overview]

```
namespace std::chrono {
  class utc_clock {
  public:
    using rep                        = a signed arithmetic type;
    using period                     = ratio<unspecified, unspecified>;
    using duration                   = chrono::duration<rep, period>;
    using time_point                 = chrono::time_point<utc_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static sys_time<common_type_t<Duration, seconds>>
        to_sys(const utc_time<Duration>& t);
    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
  };
}
```

1 In contrast to `sys_time`, which does not take leap seconds into account, `utc_clock` and its associated `time_point`, `utc_time`, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[*Note 1*: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant `sys_days{1972y/1/1} - sys_days{1970y/1/1}` (`63'072'000s`) from the `utc_time`. — *end note*]

[*Example 1*:
`clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch()` is `0s`.
`clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch()` is `946'684'822s`, which is `10'957 * 86'400s + 22s`.
— *end example*]

2 `utc_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `utc_clock::now()` does not propagate an exception.

[*Note 2*: `noexcept(from_sys(system_clock::now()))` is `false`. — *end note*]

30.7.3.2 Member functions [time.clock.utc.members]

```
static time_point now();
```

1 *Returns*: `from_sys(system_clock::now())`, or a more accurate value of `utc_time`.

```
template<class Duration>
  static sys_time<common_type_t<Duration, seconds>>
    to_sys(const utc_time<Duration>& u);
```

2 *Returns*: A `sys_time` `t`, such that `from_sys(t) == u` if such a mapping exists. Otherwise `u` represents a `time_point` during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of `sys_time` prior to the insertion of the leap second is returned.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    from_sys(const sys_time<Duration>& t);
```

3 *Returns*: A `utc_time` `u`, such that `u.time_since_epoch() - t.time_since_epoch()` is equal to the sum of leap seconds that were inserted between `t` and 1970-01-01. If `t` is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.

[*Example 1*:

```
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
```

©ISO/IEC

```
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
```

— *end example*]

30.7.3.3 Non-member functions [time.clock.utc.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
  cout << u << " UTC\n";
```

Produces this output:

```
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC
2015-07-01 00:00:00.250 UTC
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `utc_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

```
struct leap_second_info {
  bool    is_leap_second;
  seconds elapsed;
};
```

5 The type `leap_second_info` has data members and special members specified above. It has no base classes or members other than those specified.

```
template<class Duration>
  leap_second_info get_leap_second_info(const utc_time<Duration>& ut);
```

6 *Returns*: A `leap_second_info` `lsi`, where `lsi.is_leap_second` is `true` if `ut` is during a positive leap second insertion, and otherwise `false`. `lsi.elapsed` is the sum of leap seconds between 1970-01-01 and `ut`. If `lsi.is_leap_second` is `true`, the leap second referred to by `ut` is included in the sum.

30.7.4 Class `tai_clock` [time.clock.tai]

30.7.4.1 Overview [time.clock.tai.overview]

```
namespace std::chrono {
  class tai_clock {
  public:
    using rep                      = a signed arithmetic type;
    using period                   = ratio<unspecified, unspecified>;
    using duration                 = chrono::duration<rep, period>;
    using time_point               = chrono::time_point<tai_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const tai_time<Duration>&) noexcept;
    template<class Duration>
      static tai_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `tai_clock` measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

2 `tai_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `tai_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

30.7.4.2 Member functions [time.clock.tai.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `tai_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const tai_time<Duration>& t) noexcept;
```

2 *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s
```

[*Note 1*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

```
template<class Duration>
  static tai_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s
```

[*Note 2*:

```
378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
```

— *end note*]

30.7.4.3 Non-member functions [time.clock.tai.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `tai_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

30.7.5 Class gps_clock [time.clock.gps]

30.7.5.1 Overview [time.clock.gps.overview]

```
namespace std::chrono {
  class gps_clock {
  public:
    using rep                       = a signed arithmetic type;
    using period                    = ratio<unspecified, unspecified>;
    using duration                  = chrono::duration<rep, period>;
    using time_point                = chrono::time_point<gps_clock>;
    static constexpr bool is_steady = unspecified;

    static time_point now();

    template<class Duration>
      static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
    template<class Duration>
      static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
  };
}
```

1 The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from `1958y/January/1` to `1980y/January/Sunday[1]`, GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 `gps_clock` is not a *Cpp17TrivialClock* unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception.

[*Note 1*: `noexcept(from_utc(utc_clock::now()))` is `false`. — *end note*]

©ISO/IEC

30.7.5.2 Member functions [time.clock.gps.members]

```
static time_point now();
```

1 *Returns*: `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

```
template<class Duration>
  static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;
```

2 *Returns*:

```
utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
```

[*Note 1*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

```
template<class Duration>
  static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;
```

3 *Returns*:

```
gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
```

[*Note 2*:

```
315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
```

— *end note*]

30.7.5.3 Non-member functions [time.clock.gps.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

2 [*Example 1*:

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

— *end example*]

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

3 *Effects*: Attempts to parse the input stream `is` into the `gps_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

4 *Returns*: `is`.

30.7.6 Type `file_clock` [time.clock.file]

30.7.6.1 Overview [time.clock.file.overview]

```
namespace std::chrono {
  using file_clock = see below;
}
```

1 `file_clock` is an alias for a type meeting the *Cpp17TrivialClock* requirements (30.3), and using a signed arithmetic type for `file_clock::rep`. `file_clock` is used to create the `time_point` system used for `file_time_type` (31.12). Its epoch is unspecified, and `noexcept(file_clock::now())` is `true`.

[*Note 1*: The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`. — *end note*]

30.7.6.2 Member functions [time.clock.file.members]

1 The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```
template<class Duration>
  static sys_time<see below>
    to_sys(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_sys(const sys_time<Duration>&);
```

or:

```
template<class Duration>
  static utc_time<see below>
    to_utc(const file_time<Duration>&);
template<class Duration>
  static file_time<see below>
    from_utc(const utc_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

30.7.6.3 Non-member functions [time.clock.file.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

2 *Effects*: Attempts to parse the input stream `is` into the `file_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

3 *Returns*: `is`.

30.7.7 Class `steady_clock` [time.clock.steady]

```
namespace std::chrono {
  class steady_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = true;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.

30.7.8 Class `high_resolution_clock` [time.clock.hires]

```
namespace std::chrono {
  class high_resolution_clock {
  public:
    using rep        = unspecified;
    using period     = ratio<unspecified, unspecified>;
    using duration   = chrono::duration<rep, period>;
    using time_point = chrono::time_point<unspecified, duration>;
    static constexpr bool is_steady = unspecified;

    static time_point now() noexcept;
  };
}
```

1 Objects of class `high_resolution_clock` represent clocks with the shortest tick period. `high_resolution_clock` may be a synonym for `system_clock` or `steady_clock`.

30.7.9 Local time [time.clock.local]

1 The family of time points denoted by `local_time<Duration>` are based on the pseudo clock `local_t`. `local_t` has no member `now()` and thus does not meet the clock requirements. Nevertheless `local_time<Duration>` serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete `time_point` algebra is available for `local_time<Duration>` (just as for `sys_time<Duration>`).

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);
```

2 *Constraints*: `os << sys_time<Duration>lt.time_since_epoch()` is a valid expression.

3 *Effects*:

```
os << sys_time<Duration>{lt.time_since_epoch()};
```

4 *Returns*: `os`.

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

5 *Effects*: Attempts to parse the input stream `is` into the `local_time tp` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

6 *Returns*: `is`.

30.7.10 `time_point` conversions [time.clock.cast]

30.7.10.1 Class template `clock_time_conversion` [time.clock.conv]

```
namespace std::chrono {
  template<class DestClock, class SourceClock>
  struct clock_time_conversion {};
}
```

1 `clock_time_conversion` serves as a trait which can be used to specify how to convert a source `time_point` of type `time_point<SourceClock, Duration>` to a destination `time_point` of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified `operator()` that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock,`

OtherDuration> representing an equivalent point in time. OtherDuration is a chrono::duration whose specialization is computed from the input Duration in a manner which can vary for each clock_time_conversion specialization. A program may specialize clock_time_conversion if at least one of the template parameters is a user-defined clock type.

2 Several specializations are provided by the implementation, as described in 30.7.10.2, 30.7.10.3, 30.7.10.4, and 30.7.10.5.

30.7.10.2 Identity conversions [time.clock.cast.id]

```
template<class Clock>
struct clock_time_conversion<Clock, Clock> {
  template<class Duration>
    time_point<Clock, Duration>
      operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
  time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
```

1 *Returns*: t.

```
template<>
struct clock_time_conversion<system_clock, system_clock> {
  template<class Duration>
    sys_time<Duration>
      operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
  sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
```

2 *Returns*: t.

```
template<>
struct clock_time_conversion<utc_clock, utc_clock> {
  template<class Duration>
    utc_time<Duration>
      operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
  utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
```

3 *Returns*: t.

30.7.10.3 Conversions between system_clock and utc_clock [time.clock.cast.sys.utc]

```
template<>
struct clock_time_conversion<utc_clock, system_clock> {
  template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
      operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
  utc_time<common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;
```

1 *Returns*: utc_clock::from_sys(t).

```
template<>
struct clock_time_conversion<system_clock, utc_clock> {
  template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
      operator()(const utc_time<Duration>& t) const;
};
```

©ISO/IEC 1963

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;
```

2 *Returns*: `utc_clock::to_sys(t)`.

30.7.10.4 Conversions between `system_clock` and other clocks [time.clock.cast.sys]

```
template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
  template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
      -> decltype(SourceClock::to_sys(t));
};
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_sys(t));
```

1 *Constraints*: `SourceClock::to_sys(t)` is well-formed.

2 *Mandates*: `SourceClock::to_sys(t)` returns a `sys_time<Duration2>` for some type `Duration2` (30.6.1).

3 *Returns*: `SourceClock::to_sys(t)`.

```
template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
  template<class Duration>
    auto operator()(const sys_time<Duration>& t) const
      -> decltype(DestClock::from_sys(t));
};
```

```
template<class Duration>
  auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));
```

4 *Constraints*: `DestClock::from_sys(t)` is well-formed.

5 *Mandates*: `DestClock::from_sys(t)` returns a `time_point<DestClock, Duration2>` for some type `Duration2` (30.6.1).

6 *Returns*: `DestClock::from_sys(t)`.

30.7.10.5 Conversions between `utc_clock` and other clocks [time.clock.cast.utc]

```
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
  template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
      -> decltype(SourceClock::to_utc(t));
};
```

```
template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));
```

1 *Constraints*: `SourceClock::to_utc(t)` is well-formed.

2 *Mandates*: `SourceClock::to_utc(t)` returns a `utc_time<Duration2>` for some type `Duration2` (30.6.1).

3 *Returns*: `SourceClock::to_utc(t)`.

```
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
  template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
      -> decltype(DestClock::from_utc(t));
};
```

©ISO/IEC 1964

```
template<class Duration>
  auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
```

4 *Constraints*: `DestClock::from_utc(t)` is well-formed.

5 *Mandates*: `DestClock::from_utc(t)` returns a `time_point<DestClock, Duration2>` for some type `Duration2` (30.6.1).

6 *Returns*: `DestClock::from_utc(t)`.

30.7.10.6 Function template `clock_cast` [time.clock.cast.fn]

```
template<class DestClock, class SourceClock, class Duration>
  auto clock_cast(const time_point<SourceClock, Duration>& t);
```

1 *Constraints*: At least one of the following clock time conversion expressions is well-formed:

(1.1) — `clock_time_conversion<DestClock, SourceClock>{}(t)`

(1.2) — `clock_time_conversion<DestClock, system_clock>{}(clock_time_conversion<system_clock, SourceClock>{}(t))`

(1.3) — `clock_time_conversion<DestClock, utc_clock>{}(clock_time_conversion<utc_clock, SourceClock>{}(t))`

(1.4) — `clock_time_conversion<DestClock, utc_clock>{}(clock_time_conversion<utc_clock, system_clock>{}(clock_time_conversion<system_clock, SourceClock>{}(t)))`

(1.5) — `clock_time_conversion<DestClock, system_clock>{}(clock_time_conversion<system_clock, utc_clock>{}(clock_time_conversion<utc_clock, SourceClock>{}(t)))`

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

2 *Mandates*: Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

3 *Returns*: The best well-formed clock time conversion expression in the above list.

30.8 The civil calendar [time.cal]

30.8.1 General [time.cal.general]

1 The types in 30.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

30.8.2 Class `last_spec` [time.cal.last]

```
namespace std::chrono {
  struct last_spec {
    explicit last_spec() = default;
  };
}
```

1 The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

30.8.3 Class `day` [time.cal.day]

30.8.3.1 Overview [time.cal.day.overview]

```
namespace std::chrono {
  class day {
    unsigned char d_;            // exposition only
  public:
    day() = default;
    constexpr explicit day(unsigned d) noexcept;
```

©ISO/IEC 1965

```
    constexpr day& operator++()    noexcept;
    constexpr day  operator++(int) noexcept;
    constexpr day& operator--()    noexcept;
    constexpr day  operator--(int) noexcept;

    constexpr day& operator+=(const days& d) noexcept;
    constexpr day& operator-=(const days& d) noexcept;

    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `day` represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `day`'s unspecified internal storage. `day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `days` objects, which represent a difference between two `day` objects.

2 `day` is a trivially copyable and standard-layout class type.

30.8.3.2 Member functions [time.cal.day.members]

`constexpr explicit day(unsigned d) noexcept;`

1 *Effects*: Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range $[0, 255]$.

`constexpr day& operator++() noexcept;`

2 *Effects*: `++d_`.

3 *Returns*: `*this`.

`constexpr day operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr day& operator--() noexcept;`

6 *Effects*: Equivalent to: `--d_`.

7 *Returns*: `*this`.

`constexpr day operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr day& operator+=(const days& d) noexcept;`

10 *Effects*: `*this = *this + d`.

11 *Returns*: `*this`.

`constexpr day& operator-=(const days& d) noexcept;`

12 *Effects*: `*this = *this - d`.

13 *Returns*: `*this`.

`constexpr explicit operator unsigned() const noexcept;`

14 *Returns*: `d_`.

`constexpr bool ok() const noexcept;`

15 *Returns*: `1 <= d_ && d_ <= 31`.

©ISO/IEC 1966

30.8.3.3 Non-member functions [time.cal.day.nonmembers]

```
constexpr bool operator==(const day& x, const day& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr day operator+(const day& x, const days& y) noexcept;
```

3 *Returns*: `day(unsigned{x} + y.count())`.

```
constexpr day operator+(const days& x, const day& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr day operator-(const day& x, const days& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr days operator-(const day& x, const day& y) noexcept;
```

6 *Returns*: `days{int(unsigned{x}) - int(unsigned{y})}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const day& d);
```

7 *Effects*: Equivalent to:

```
return os << (d.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
  format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `day` `d` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid day, `is.setstate(ios_base::failbit)` is called and `d` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::day operator""d(unsigned long long d) noexcept;
```

10 *Returns*: `day{static_cast<unsigned>(d)}`.

30.8.4 Class `month` [time.cal.month]

30.8.4.1 Overview [time.cal.month.overview]

```
namespace std::chrono {
  class month {
    unsigned char m_;           // exposition only
  public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;

    constexpr month& operator++()    noexcept;
    constexpr month  operator++(int) noexcept;
    constexpr month& operator--()    noexcept;
    constexpr month  operator--(int) noexcept;

    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;
```

©ISO/IEC 1967

```
    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month` represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `month`'s unspecified internal storage. `month` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `months` objects, which represent a difference between two `month` objects.

2 `month` is a trivially copyable and standard-layout class type.

30.8.4.2 Member functions [time.cal.month.members]

```
constexpr explicit month(unsigned m) noexcept;
```

1 *Effects*: Initializes *m_* with `m`. The value held is unspecified if `m` is not in the range $[0, 255]$.

```
constexpr month& operator++() noexcept;
```

2 *Effects*: `*this += months{1}`.

3 *Returns*: `*this`.

```
constexpr month operator++(int) noexcept;
```

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator--() noexcept;
```

6 *Effects*: `*this -= months{1}`.

7 *Returns*: `*this`.

```
constexpr month operator--(int) noexcept;
```

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr month& operator+=(const months& m) noexcept;
```

10 *Effects*: `*this = *this + m`.

11 *Returns*: `*this`.

```
constexpr month& operator-=(const months& m) noexcept;
```

12 *Effects*: `*this = *this - m`.

13 *Returns*: `*this`.

```
constexpr explicit operator unsigned() const noexcept;
```

14 *Returns*: *m_*.

```
constexpr bool ok() const noexcept;
```

15 *Returns*: `1 <= m_ && m_ <= 12`.

30.8.4.3 Non-member functions [time.cal.month.nonmembers]

```
constexpr bool operator==(const month& x, const month& y) noexcept;
```

1 *Returns*: `unsigned{x} == unsigned{y}`.

```
constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
```

2 *Returns*: `unsigned{x} <=> unsigned{y}`.

```
constexpr month operator+(const month& x, const months& y) noexcept;
```

3 *Returns*:

```
  month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
```

©ISO/IEC 1968

where `modulo(n, 12)` computes the remainder of `n` divided by 12 using Euclidean division.

[*Note 1*: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of $[0, 11]$. Assuming no overflow in the signed summation, this operation results in a `month` holding a value in the range $[1, 12]$ even if `!x.ok()`. — *end note*]

[*Example 1*: `February + months{11} == January`. — *end example*]

```
constexpr month operator+(const months& x, const month& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr month operator-(const month& x, const months& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr months operator-(const month& x, const month& y) noexcept;
```

6 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `m` in the range [`months{0}`, `months{11}`] satisfying `y + m == x`. Otherwise the value returned is unspecified.

[*Example 2*: `January - February == months{11}`. — *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month& m);
```

7 *Effects*: Equivalent to:

```
return os << (m.ok() ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
         static_cast<unsigned>(m)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `month` `m` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid month, `is.setstate(ios_base::failbit)` is called and `m` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

30.8.5 Class `year` [time.cal.year]

30.8.5.1 Overview [time.cal.year.overview]

```
namespace std::chrono {
  class year {
    short y_;                    // exposition only
  public:
    year() = default;
    constexpr explicit year(int y) noexcept;

    constexpr year& operator++()    noexcept;
    constexpr year  operator++(int) noexcept;
    constexpr year& operator--()    noexcept;
    constexpr year  operator--(int) noexcept;

    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;

    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;

    constexpr bool is_leap() const noexcept;
```

©ISO/IEC 1969

```
    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;

    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
  };
}
```

1 `year` represents a year in the civil calendar. It can represent values in the range [`min()`,`max()`]. It can be constructed with any `int` value, which will be subsequently truncated to fit into `year`'s unspecified internal storage. `year` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements, and participates in basic arithmetic with `years` objects, which represent a difference between two `year` objects.

2 `year` is a trivially copyable and standard-layout class type.

30.8.5.2 Member functions [time.cal.year.members]

`constexpr explicit year(int y) noexcept;`

1 *Effects*: Initializes `y_` with `y`. The value held is unspecified if `y` is not in the range [`-32767`, `32767`].

`constexpr year& operator++() noexcept;`

2 *Effects*: `++y_`.

3 *Returns*: `*this`.

`constexpr year operator++(int) noexcept;`

4 *Effects*: `++(*this)`.

5 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr year& operator--() noexcept;`

6 *Effects*: `--y_`.

7 *Returns*: `*this`.

`constexpr year operator--(int) noexcept;`

8 *Effects*: `--(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

`constexpr year& operator+=(const years& y) noexcept;`

10 *Effects*: `*this = *this + y`.

11 *Returns*: `*this`.

`constexpr year& operator-=(const years& y) noexcept;`

12 *Effects*: `*this = *this - y`.

13 *Returns*: `*this`.

`constexpr year operator+() const noexcept;`

14 *Returns*: `*this`.

`constexpr year operator-() const noexcept;`

15 *Returns*: `year{-y_}`.

`constexpr bool is_leap() const noexcept;`

16 *Returns*: `y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0)`.

`constexpr explicit operator int() const noexcept;`

17 *Returns*: `y_`.

`constexpr bool ok() const noexcept;`

18 *Returns*: `min().y_ <= y_ && y_ <= max().y_`.

©ISO/IEC 1970

```
static constexpr year min() noexcept;
```

19 *Returns*: `year{-32767}`.

```
static constexpr year max() noexcept;
```

20 *Returns*: `year{32767}`.

30.8.5.3 Non-member functions [time.cal.year.nonmembers]

```
constexpr bool operator==(const year& x, const year& y) noexcept;
```

1 *Returns*: `int{x} == int{y}`.

```
constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
```

2 *Returns*: `int{x} <=> int{y}`.

```
constexpr year operator+(const year& x, const years& y) noexcept;
```

3 *Returns*: `year{int{x} + static_cast<int>(y.count())}`.

```
constexpr year operator+(const years& x, const year& y) noexcept;
```

4 *Returns*: `y + x`.

```
constexpr year operator-(const year& x, const years& y) noexcept;
```

5 *Returns*: `x + -y`.

```
constexpr years operator-(const year& x, const year& y) noexcept;
```

6 *Returns*: `years{int{x} - int{y}}`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year& y);
```

7 *Effects*: Equivalent to:

```
return os << (y.ok() ?
  format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
  format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

8 *Effects*: Attempts to parse the input stream `is` into the `year` `y` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid year, `is.setstate(ios_base::failbit)` is called and `y` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

9 *Returns*: `is`.

```
constexpr chrono::year operator""y(unsigned long long y) noexcept;
```

10 *Returns*: `year{static_cast<int>(y)}`.

30.8.6 Class `weekday` [time.cal.wd]

30.8.6.1 Overview [time.cal.wd.overview]

```
namespace std::chrono {
  class weekday {
    unsigned char wd_;          // exposition only
  public:
    weekday() = default;
    constexpr explicit weekday(unsigned wd) noexcept;
    constexpr weekday(const sys_days& dp) noexcept;
    constexpr explicit weekday(const local_days& dp) noexcept;
```

©ISO/IEC 1971

```
    constexpr weekday& operator++()    noexcept;
    constexpr weekday  operator++(int) noexcept;
    constexpr weekday& operator--()    noexcept;
    constexpr weekday  operator--(int) noexcept;

    constexpr weekday& operator+=(const days& d) noexcept;
    constexpr weekday& operator-=(const days& d) noexcept;

    constexpr unsigned c_encoding() const noexcept;
    constexpr unsigned iso_encoding() const noexcept;
    constexpr bool ok() const noexcept;

    constexpr weekday_indexed operator[](unsigned index) const noexcept;
    constexpr weekday_last    operator[](last_spec) const noexcept;
  };
}
```

1 `weekday` represents a day of the week in the civil calendar. It normally holds values in the range `0` to `6`, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `weekday`'s unspecified internal storage. `weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

[*Note 1*: `weekday` is not *Cpp17LessThanComparable* because there is no universal consensus on which day is the first day of the week. `weekday`'s arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — *end note*]

2 `weekday` is a trivially copyable and standard-layout class type.

30.8.6.2 Member functions [time.cal.wd.members]

```
constexpr explicit weekday(unsigned wd) noexcept;
```

1 *Effects*: Initializes *wd_* with `wd == 7 ? 0 : wd`. The value held is unspecified if `wd` is not in the range $[0, 255]$.

```
constexpr weekday(const sys_days& dp) noexcept;
```

2 *Effects*: Computes what day of the week corresponds to the `sys_days dp`, and initializes that day of the week in *wd_*.

3 [*Example 1*: If `dp` represents 1970-01-01, the constructed `weekday` represents Thursday by storing `4` in *wd_*. — *end example*]

```
constexpr explicit weekday(const local_days& dp) noexcept;
```

4 *Effects*: Computes what day of the week corresponds to the `local_days dp`, and initializes that day of the week in *wd_*.

5 *Postconditions*: The value is identical to that constructed from `sys_days{dp.time_since_epoch()}`.

```
constexpr weekday& operator++() noexcept;
```

6 *Effects*: `*this += days{1}`.

7 *Returns*: `*this`.

```
constexpr weekday operator++(int) noexcept;
```

8 *Effects*: `++(*this)`.

9 *Returns*: A copy of `*this` as it existed on entry to this member function.

```
constexpr weekday& operator--() noexcept;
```

10 *Effects*: `*this -= days{1}`.

11 *Returns*: `*this`.

```
constexpr weekday operator--(int) noexcept;
```

12 *Effects*: `--(*this)`.

13 *Returns*: A copy of `*this` as it existed on entry to this member function.

©ISO/IEC 1972

```
constexpr weekday& operator+=(const days& d) noexcept;
```

14 *Effects*: `*this = *this + d`.

15 *Returns*: `*this`.

```
constexpr weekday& operator-=(const days& d) noexcept;
```

16 *Effects*: `*this = *this - d`.

17 *Returns*: `*this`.

```
constexpr unsigned c_encoding() const noexcept;
```

18 *Returns*: *wd_*.

```
constexpr unsigned iso_encoding() const noexcept;
```

19 *Returns*: *wd_* `== 0u ? 7u :` *wd_*.

```
constexpr bool ok() const noexcept;
```

20 *Returns*: *wd_* `<= 6`.

```
constexpr weekday_indexed operator[](unsigned index) const noexcept;
```

21 *Returns*: `{*this, index}`.

```
constexpr weekday_last operator[](last_spec) const noexcept;
```

22 *Returns*: `weekday_last{*this}`.

30.8.6.3 Non-member functions [time.cal.wd.nonmembers]

```
constexpr bool operator==(const weekday& x, const weekday& y) noexcept;
```

1 *Returns*: `x.`*wd_* `== y.`*wd_*.

```
constexpr weekday operator+(const weekday& x, const days& y) noexcept;
```

2 *Returns*:

```
weekday{modulo(static_cast<long long>(x.wd_) + y.count(), 7)}
```

where `modulo(n, 7)` computes the remainder of `n` divided by 7 using Euclidean division.

[*Note 1*: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of $[0, 6]$. Assuming no overflow in the signed summation, this operation results in a `weekday` holding a value in the range $[0, 6]$ even if `!x.ok()`. — *end note*]

[*Example 1*: `Monday + days{6} == Sunday`. — *end example*]

```
constexpr weekday operator+(const days& x, const weekday& y) noexcept;
```

3 *Returns*: `y + x`.

```
constexpr weekday operator-(const weekday& x, const days& y) noexcept;
```

4 *Returns*: `x + -y`.

```
constexpr days operator-(const weekday& x, const weekday& y) noexcept;
```

5 *Returns*: If `x.ok() == true` and `y.ok() == true`, returns a value `d` in the range $[$`days{0}`, `days{6}`$]$ satisfying `y + d == x`. Otherwise the value returned is unspecified.

[*Example 2*: `Sunday - Monday == days{6}`. — *end example*]

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday& wd);
```

6 *Effects*: Equivalent to:

```
return os << (wd.ok() ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%a}"), wd) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid weekday"),
         static_cast<unsigned>(wd.wd_)));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

7 *Effects*: Attempts to parse the input stream `is` into the `weekday` `wd` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid weekday, `is.setstate(ios_base::failbit)` is called and `wd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

8 *Returns*: `is`.

30.8.7 Class `weekday_indexed` [time.cal.wdidx]

30.8.7.1 Overview [time.cal.wdidx.overview]

```
namespace std::chrono {
  class weekday_indexed {
    chrono::weekday  wd_;       // exposition only
    unsigned char    index_;    // exposition only

  public:
    weekday_indexed() = default;
    constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned        index()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_indexed` represents a `weekday` and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

2 [*Note 1*: A `weekday_indexed` object can be constructed by indexing a `weekday` with an `unsigned`. — *end note*]

[*Example 1*:

```
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
```

— *end example*]

3 `weekday_indexed` is a trivially copyable and standard-layout class type.

30.8.7.2 Member functions [time.cal.wdidx.members]

```
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
```

1 *Effects*: Initializes *`wd_`* with `wd` and *`index_`* with `index`. The values held are unspecified if `!wd.ok()` or `index` is not in the range $[0, 7]$.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: *`wd_`*.

```
constexpr unsigned index() const noexcept;
```

3 *Returns*: *`index_`*.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: *`wd_`*`.ok() && 1 <= `*`index_`*` && `*`index_`*` <= 5`.

30.8.7.3 Non-member functions [time.cal.wdidx.nonmembers]

```
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday() && x.index() == y.index()`.

©ISO/IEC 1974

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
```

2 *Effects*: Equivalent to:

```
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{}]"), wdi.weekday(), i) :
  format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{} is not a valid index]"),
         wdi.weekday(), i));
```

30.8.8 Class `weekday_last` [time.cal.wdlast]

30.8.8.1 Overview [time.cal.wdlast.overview]

```
namespace std::chrono {
  class weekday_last {
    chrono::weekday wd_;                // exposition only

  public:
    constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;

    constexpr chrono::weekday weekday() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `weekday_last` represents the last weekday of a month.

2 [*Note 1*: A `weekday_last` object can be constructed by indexing a `weekday` with `last`. — *end note*]

[*Example 1*:

```
constexpr auto wdl = Sunday[last];      // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
```

— *end example*]

3 `weekday_last` is a trivially copyable and standard-layout class type.

30.8.8.2 Member functions [time.cal.wdlast.members]

```
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 *Effects*: Initializes *wd_* with `wd`.

```
constexpr chrono::weekday weekday() const noexcept;
```

2 *Returns*: *wd_*.

```
constexpr bool ok() const noexcept;
```

3 *Returns*: *wd_*`.ok()`.

30.8.8.3 Non-member functions [time.cal.wdlast.nonmembers]

```
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 *Returns*: `x.weekday() == y.weekday()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[last]"), wdl.weekday());
```

30.8.9 Class `month_day` [time.cal.md]

30.8.9.1 Overview [time.cal.md.overview]

```
namespace std::chrono {
  class month_day {
    chrono::month m_;           // exposition only
```

©ISO/IEC 1975

```
    chrono::day   d_;            // exposition only

  public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day` represents a specific day of a specific month, but with an unspecified year. `month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `month_day` is a trivially copyable and standard-layout class type.

30.8.9.2 Member functions [time.cal.md.members]

```
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

1 *Effects*: Initializes *m_* with `m`, and *d_* with `d`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: *m_*.

```
constexpr chrono::day day() const noexcept;
```

3 *Returns*: *d_*.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: `true` if *m_*`.ok()` is `true`, `1d <=` *d_*, and *d_* is less than or equal to the number of days in month *m_*; otherwise returns `false`. When *m_* `== February`, the number of days is considered to be 29.

30.8.9.3 Non-member functions [time.cal.md.nonmembers]

```
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
```

1 *Returns*: `x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
  if (auto c = x.month() <=> y.month(); c != 0) return c;
  return x.day() <=> y.day();
```

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day& md);
```

3 *Effects*: Equivalent to:

```
  return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{}"),
                      md.month(), md.day());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

4 *Effects*: Attempts to parse the input stream `is` into the `month_day` `md` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `month_day`, `is.setstate(ios_base::failbit)` is called and `md` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

5 *Returns*: `is`.

©ISO/IEC 1976

30.8.10 Class `month_day_last` [time.cal.mdlast]

```
namespace std::chrono {
  class month_day_last {
    chrono::month m_;                    // exposition only

  public:
    constexpr explicit month_day_last(const chrono::month& m) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_day_last` represents the last day of a month.

2 [*Note 1*: A `month_day_last` object can be constructed using the expression `m/last` or `last/m`, where `m` is an expression of type `month`. — *end note*]

[*Example 1*:

```
constexpr auto mdl = February/last;      // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

— *end example*]

3 `month_day_last` is a trivially copyable and standard-layout class type.

```
constexpr explicit month_day_last(const chrono::month& m) noexcept;
```

4 *Effects*: Initializes *m_* with `m`.

```
constexpr month month() const noexcept;
```

5 *Returns*: *m_*.

```
constexpr bool ok() const noexcept;
```

6 *Returns*: *m_*`.ok()`.

```
constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;
```

7 *Returns*: `x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;
```

8 *Returns*: `x.month() <=> y.month()`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);
```

9 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/last"), mdl.month());
```

30.8.11 Class `month_weekday` [time.cal.mwd]

30.8.11.1 Overview [time.cal.mwd.overview]

```
namespace std::chrono {
  class month_weekday {
    chrono::month           m_;          // exposition only
    chrono::weekday_indexed wdi_;        // exposition only
  public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr chrono::month           month()           const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday` represents the n^{th} weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a `month` and a `weekday_indexed`.

©ISO/IEC 1977

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[3];              // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

— *end example*]

3 `month_weekday` is a trivially copyable and standard-layout class type.

30.8.11.2 Member functions [time.cal.mwd.members]

```
constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes *m_* with `m`, and *wdi_* with `wdi`.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: *m_*.

```
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

3 *Returns*: *wdi_*.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: *m_*.ok() && *wdi_*.ok().

30.8.11.3 Non-member functions [time.cal.mwd.nonmembers]

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

1 *Returns*: x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed().

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                    mwd.month(), mwd.weekday_indexed());
```

30.8.12 Class `month_weekday_last` [time.cal.mwdlast]

30.8.12.1 Overview [time.cal.mwdlast.overview]

```
namespace std::chrono {
  class month_weekday_last {
    chrono::month        m_;    // exposition only
    chrono::weekday_last wdl_;  // exposition only
  public:
    constexpr month_weekday_last(const chrono::month& m,
                                 const chrono::weekday_last& wdl) noexcept;

    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `month_weekday_last` represents the last weekday of a month, of an as yet unspecified year. To do this the `month_weekday_last` stores a `month` and a `weekday_last`.

2 [*Example 1*:

```
constexpr auto mwd
    = February/Tuesday[last];   // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
```

— *end example*]

3 `month_weekday_last` is a trivially copyable and standard-layout class type.

©ISO/IEC 1978

30.8.12.2 Member functions [time.cal.mwdlast.members]

```
constexpr month_weekday_last(const chrono::month& m,
                             const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes *m_* with m, and *wdl_* with wdl.

```
constexpr chrono::month month() const noexcept;
```

2 *Returns*: *m_*.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

3 *Returns*: *wdl_*.

```
constexpr bool ok() const noexcept;
```

4 *Returns*: *m_*.ok() && *wdl_*.ok().

30.8.12.3 Non-member functions [time.cal.mwdlast.nonmembers]

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

1 *Returns*: x.month() == y.month() && x.weekday_last() == y.weekday_last().

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                    mwdl.month(), mwdl.weekday_last());
```

30.8.13 Class year_month [time.cal.ym]

30.8.13.1 Overview [time.cal.ym.overview]

```
namespace std::chrono {
  class year_month {
    chrono::year  y_;            // exposition only
    chrono::month m_;            // exposition only

  public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;

    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy)  noexcept;
    constexpr year_month& operator-=(const years& dy)  noexcept;

    constexpr bool ok() const noexcept;
  };
}
```

1 year_month represents a specific month of a specific year, but with an unspecified day. year_month is a field-based time point with a resolution of months. year_month meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 year_month is a trivially copyable and standard-layout class type.

30.8.13.2 Member functions [time.cal.ym.members]

```
constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
```

1 *Effects*: Initializes *y_* with y, and *m_* with m.

©ISO/IEC 1979

```
constexpr chrono::year year() const noexcept;
```

2 *Returns*: `y_`.

```
constexpr chrono::month month() const noexcept;
```

3 *Returns*: `m_`.

```
constexpr year_month& operator+=(const months& dm) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Effects*: `*this = *this + dm`.

6 *Returns*: `*this`.

```
constexpr year_month& operator-=(const months& dm) noexcept;
```

7 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

8 *Effects*: `*this = *this - dm`.

9 *Returns*: `*this`.

```
constexpr year_month& operator+=(const years& dy) noexcept;
```

10 *Effects*: `*this = *this + dy`.

11 *Returns*: `*this`.

```
constexpr year_month& operator-=(const years& dy) noexcept;
```

12 *Effects*: `*this = *this - dy`.

13 *Returns*: `*this`.

```
constexpr bool ok() const noexcept;
```

14 *Returns*: `y_.ok() && m_.ok()`.

30.8.13.3 Non-member functions [time.cal.ym.nonmembers]

```
constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month()`.

```
constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month() <=> y.month();
```

```
constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

4 *Returns*: A `year_month` value `z` such that `z.ok() && z - ym == dm` is `true`.

5 *Complexity*: $\mathcal{O}(1)$ with respect to the value of `dm`.

```
constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ym + dm`.

```
constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Returns*: `ym + -dm`.

©ISO/IEC 1980

```
constexpr months operator-(const year_month& x, const year_month& y) noexcept;
```

10 *Returns*:

```
x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
                             static_cast<int>(unsigned{y.month()})}
```

```
constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
```

11 *Returns*: `(ym.year() + dy) / ym.month()`.

```
constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
```

12 *Returns*: `ym + dy`.

```
constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
```

13 *Returns*: `ym + -dy`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month& ym);
```

14 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
                    ym.year(), ym.month());
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month` `ym` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `year_month`, `is.setstate(ios_base::failbit)` is called and `ym` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns*: `is`.

30.8.14 Class `year_month_day` [time.cal.ymd]

30.8.14.1 Overview [time.cal.ymd.overview]

```
namespace std::chrono {
  class year_month_day {
    chrono::year  y_;            // exposition only
    chrono::month m_;            // exposition only
    chrono::day   d_;            // exposition only

  public:
    year_month_day() = default;
    constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                             const chrono::day& d) noexcept;
    constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
    constexpr year_month_day(const sys_days& dp) noexcept;
    constexpr explicit year_month_day(const local_days& dp) noexcept;

    constexpr year_month_day& operator+=(const months& m) noexcept;
    constexpr year_month_day& operator-=(const months& m) noexcept;
    constexpr year_month_day& operator+=(const years& y)  noexcept;
    constexpr year_month_day& operator-=(const years& y)  noexcept;

    constexpr chrono::year  year()  const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::day   day()   const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
```

©ISO/IEC 1981

```
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_day` represents a specific year, month, and day. `year_month_day` is a field-based time point with a resolution of `days`.

[*Note 1*: `year_month_day` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

2 `year_month_day` is a trivially copyable and standard-layout class type.

30.8.14.2 Member functions [time.cal.ymd.members]

```
constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;
```

1 *Effects*: Initializes *y_* with `y`, *m_* with `m`, and *d_* with `d`.

```
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
```

2 *Effects*: Initializes *y_* with `ymdl.year()`, *m_* with `ymdl.month()`, and *d_* with `ymdl.day()`.

[*Note 1*: This conversion from `year_month_day_last` to `year_month_day` can be more efficient than converting a `year_month_day_last` to a `sys_days`, and then converting that `sys_days` to a `year_month_day`. — *end note*]

```
constexpr year_month_day(const sys_days& dp) noexcept;
```

3 *Effects*: Constructs an object of type `year_month_day` that corresponds to the date represented by `dp`.

4 *Remarks*: For any value `ymd` of type `year_month_day` for which `ymd.ok()` is `true`, `ymd == year_month_day{sys_days{ymd}}` is `true`.

```
constexpr explicit year_month_day(const local_days& dp) noexcept;
```

5 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_day& operator+=(const months& m) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Effects*: `*this = *this + m`.

8 *Returns*: `*this`.

```
constexpr year_month_day& operator-=(const months& m) noexcept;
```

9 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

10 *Effects*: `*this = *this - m`.

11 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
```

12 *Effects*: `*this = *this + y`.

13 *Returns*: `*this`.

```
constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
```

14 *Effects*: `*this = *this - y`.

15 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

16 *Returns*: *y_*.

```
constexpr chrono::month month() const noexcept;
```

17 *Returns*: *m_*.

©ISO/IEC 1982

```
constexpr chrono::day day() const noexcept;
```

18 *Returns*: *d_*.

```
constexpr operator sys_days() const noexcept;
```

19 *Returns*: If `ok()`, returns a `sys_days` holding a count of days from the `sys_days` epoch to `*this` (a negative value if `*this` represents a date prior to the `sys_days` epoch). Otherwise, if *y_*`.ok()` `&&` *m_*`.ok()` is `true`, returns `sys_days{`*y_*`/`*m_*`/1d} + (`*d_* `- 1d)`. Otherwise the value returned is unspecified.

20 *Remarks*: A `sys_days` in the range [`days{-12687428}`, `days{11248737}`] which is converted to a `year_month_day` has the same value when converted back to a `sys_days`.

21 [*Example 1*:

```
static_assert(year_month_day{sys_days{2017y/January/0}}  == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
```

— *end example*]

```
constexpr explicit operator local_days() const noexcept;
```

22 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

23 *Returns*: If *y_*`.ok()` is `true`, and *m_*`.ok()` is `true`, and *d_* is in the range [`1d`, (*y_*`/`*m_*`/last).day()`], then returns `true`; otherwise returns `false`.

30.8.14.3 Non-member functions [time.cal.ymd.nonmembers]

```
constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
```

1 *Returns*: `x.year() == y.year() && x.month() == y.month() && x.day() == y.day()`.

```
constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;
```

2 *Effects*: Equivalent to:

```
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();
```

```
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
```

3 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

4 *Returns*: `(ymd.year() / ymd.month() + dm) / ymd.day()`.

5 [*Note 1*: If `ymd.day()` is in the range [`1d`, `28d`], `ok()` will return `true` for the resultant `year_month_day`. — *end note*]

```
constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymd + dm`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Returns*: `ymd + (-dm)`.

```
constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
```

10 *Returns*: `(ymd.year() + dy) / ymd.month() / ymd.day()`.

11 [*Note 2*: If `ymd.month()` is February and `ymd.day()` is not in the range [`1d`, `28d`], `ok()` can return `false` for the resultant `year_month_day`. — *end note*]

©ISO/IEC 1983

```
constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
```

12 *Returns*: `ymd + dy`.

```
constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
```

13 *Returns*: `ymd + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
```

14 *Effects*: Equivalent to:

```
  return os << (ymd.ok() ?
    format(STATICALLY-WIDEN<charT>("{:%F}"), ymd) :
    format(STATICALLY-WIDEN<charT>("{:%F} is not a valid date"), ymd));
```

```
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);
```

15 *Effects*: Attempts to parse the input stream `is` into the `year_month_day` `ymd` using the format flags given in the NTCTS `fmt` as specified in 30.13. If the parse fails to decode a valid `year_month_day`, `is.setstate(ios_base::failbit)` is called and `ymd` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null.

16 *Returns*: `is`.

30.8.15 Class `year_month_day_last` [time.cal.ymdlast]

30.8.15.1 Overview [time.cal.ymdlast.overview]

```
namespace std::chrono {
  class year_month_day_last {
    chrono::year           y_;          // exposition only
    chrono::month_day_last mdl_;        // exposition only

  public:
    constexpr year_month_day_last(const chrono::year& y,
                                  const chrono::month_day_last& mdl) noexcept;

    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y)  noexcept;
    constexpr year_month_day_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year           year()           const noexcept;
    constexpr chrono::month          month()          const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day            day()            const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_day_last` represents the last day of a specific year and month. `year_month_day_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last day of a year and month.

[*Note 1*: `year_month_day_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_day_last` meets the *Cpp17EqualityComparable* (Table 28) and *Cpp17LessThanComparable* (Table 29) requirements.

©ISO/IEC 1984

2 `year_month_day_last` is a trivially copyable and standard-layout class type.

30.8.15.2 Member functions [time.cal.ymdlast.members]

```
constexpr year_month_day_last(const chrono::year& y,
                              const chrono::month_day_last& mdl) noexcept;
```

1 *Effects*: Initializes *y_* with `y` and *mdl_* with `mdl`.

```
constexpr year_month_day_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

    chrono::weekday_indexed wdi_;       // exposition only

  public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                                 const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

©ISO/IEC 1986

```
    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y)  noexcept;
    constexpr year_month_weekday& operator-=(const years& y)  noexcept;

    constexpr chrono::year            year()            const noexcept;
    constexpr chrono::month           month()           const noexcept;
    constexpr chrono::weekday         weekday()         const noexcept;
    constexpr unsigned                index()           const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_weekday` represents a specific year, month, and n^{th} weekday of the month. `year_month_weekday` is a field-based time point with a resolution of `days`.

[*Note 1*: `year_month_weekday` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday` meets the *Cpp17EqualityComparable* (Table 28) requirements.

2 `year_month_weekday` is a trivially copyable and standard-layout class type.

30.8.16.2 Member functions [time.cal.ymwd.members]

```
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

1 *Effects*: Initializes *y_* with `y`, *m_* with `m`, and *wdi_* with `wdi`.

```
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

2 *Effects*: Constructs an object of type `year_month_weekday` which corresponds to the date represented by `dp`.

3 *Remarks*: For any value `ymwd` of type `year_month_weekday` for which `ymwd.ok()` is `true`, `ymwd == year_month_weekday{sys_days{ymwd}}` is `true`.

```
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

4 *Effects*: Equivalent to constructing with `sys_days{dp.time_since_epoch()}`.

```
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects*: `*this = *this + m`.

7 *Returns*: `*this`.

```

```

8 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

9 *Effects*: `*this = *this - m`.

10 *Returns*: `*this`.

```
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

11 *Effects*: `*this = *this + y`.

12 *Returns*: `*this`.

```
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

13 *Effects*: `*this = *this - y`.

14 *Returns*: `*this`.

©ISO/IEC 1987

`constexpr chrono::year year() const noexcept;`

15 *Returns*: *y_*.

`constexpr chrono::month month() const noexcept;`

16 *Returns*: *m_*.

`constexpr chrono::weekday weekday() const noexcept;`

17 *Returns*: *wdi_*.weekday().

`constexpr unsigned index() const noexcept;`

18 *Returns*: *wdi_*.index().

`constexpr chrono::weekday_indexed weekday_indexed() const noexcept;`

19 *Returns*: *wdi_*.

`constexpr operator sys_days() const noexcept;`

20 *Returns*: If *y_*.ok() && *m_*.ok() && *wdi_*.weekday().ok(), returns a `sys_days` that represents the date `(index() - 1) * 7` days after the first `weekday()` of `year()/month()`. If `index()` is 0 the returned `sys_days` represents the date 7 days prior to the first `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

`constexpr explicit operator local_days() const noexcept;`

21 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

`constexpr bool ok() const noexcept;`

22 *Returns*: If any of *y_*.ok(), *m_*.ok(), or *wdi_*.ok() is `false`, returns `false`. Otherwise, if `*this` represents a valid date, returns `true`. Otherwise, returns `false`.

30.8.16.3 Non-member functions [time.cal.ymwd.nonmembers]

`constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;`

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()
```

`constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;`

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Returns*: `(ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed()`.

`constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;`

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Returns*: `ymwd + dm`.

`constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;`

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymwd + (-dm)`.

`constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const years& dy) noexcept;`

8 *Returns*: `{ymwd.year()+dy, ymwd.month(), ymwd.weekday_indexed()}`.

`constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;`

9 *Returns*: `ymwd + dy`.

`constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;`

10 *Returns*: `ymwd + (-dy)`.

©ISO/IEC 1988

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                    ymwd.year(), ymwd.month(), ymwd.weekday_indexed());
```

30.8.17 Class `year_month_weekday_last` [time.cal.ymwdlast]

30.8.17.1 Overview [time.cal.ymwdlast.overview]

```
namespace std::chrono {
  class year_month_weekday_last {
    chrono::year         y_;    // exposition only
    chrono::month        m_;    // exposition only
    chrono::weekday_last wdl_;  // exposition only

  public:
    constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                      const chrono::weekday_last& wdl) noexcept;

    constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator+=(const years& y)  noexcept;
    constexpr year_month_weekday_last& operator-=(const years& y)  noexcept;

    constexpr chrono::year         year()         const noexcept;
    constexpr chrono::month        month()        const noexcept;
    constexpr chrono::weekday      weekday()      const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;

    constexpr          operator sys_days()   const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}
```

1 `year_month_weekday_last` represents a specific year, month, and last weekday of the month. `year_month_weekday_last` is a field-based time point with a resolution of `days`, except that it is restricted to pointing to the last weekday of a year and month.

[*Note 1*: `year_month_weekday_last` supports `years`- and `months`-oriented arithmetic, but not `days`-oriented arithmetic. For the latter, there is a conversion to `sys_days`, which efficiently supports `days`-oriented arithmetic. — *end note*]

`year_month_weekday_last` meets the *Cpp17EqualityComparable* (Table 28) requirements.

2 `year_month_weekday_last` is a trivially copyable and standard-layout class type.

30.8.17.2 Member functions [time.cal.ymwdlast.members]

```
constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
                                  const chrono::weekday_last& wdl) noexcept;
```

1 *Effects*: Initializes `y_` with `y`, `m_` with `m`, and `wdl_` with `wdl`.

```
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Effects*: `*this = *this + m`.

4 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
```

5 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

6 *Effects*: `*this = *this - m`.

©ISO/IEC 1989

7 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
```

8 *Effects*: `*this = *this + y`.

9 *Returns*: `*this`.

```
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
```

10 *Effects*: `*this = *this - y`.

11 *Returns*: `*this`.

```
constexpr chrono::year year() const noexcept;
```

12 *Returns*: *y_*.

```
constexpr chrono::month month() const noexcept;
```

13 *Returns*: *m_*.

```
constexpr chrono::weekday weekday() const noexcept;
```

14 *Returns*: *wdl_*`.weekday()`.

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

15 *Returns*: *wdl_*.

```
constexpr operator sys_days() const noexcept;
```

16 *Returns*: If `ok() == true`, returns a `sys_days` that represents the last `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```
constexpr explicit operator local_days() const noexcept;
```

17 *Returns*: `local_days{sys_days{*this}.time_since_epoch()}`.

```
constexpr bool ok() const noexcept;
```

18 *Returns*: *y_*`.ok() &&` *m_*`.ok() &&` *wdl_*`.ok()`.

30.8.17.3 Non-member functions [time.cal.ymwdlast.nonmembers]

```
constexpr bool operator==(const year_month_weekday_last& x,
                          const year_month_weekday_last& y) noexcept;
```

1 *Returns*:

```
x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last()
```

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

2 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

3 *Returns*: `(ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last()`.

```
constexpr year_month_weekday_last
  operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;
```

4 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

5 *Returns*: `ymwdl + dm`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
```

6 *Constraints*: If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

7 *Returns*: `ymwdl + (-dm)`.

©ISO/IEC 1990

```
constexpr year_month_weekday_last
  operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

8 *Returns*: `{ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
```

9 *Returns*: `ymwdl + dy`.

```
constexpr year_month_weekday_last
  operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;
```

10 *Returns*: `ymwdl + (-dy)`.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
```

11 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"),
                    ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
```

30.8.18 Conventional syntax operators [time.cal.operators]

1 A set of overloaded `operator/` functions provides a conventional syntax for the creation of civil calendar dates.

2 [*Note 1*: The year, month, and day are accepted in any of the following 3 orders:

year`/`*month*`/`*day*
month`/`*day*`/`*year*
day`/`*month*`/`*year*

Anywhere a *day* is needed, any of the following can also be specified:

`last`
weekday`[`*i*`]`
weekday`[last]`

— *end note*]

3 [*Note 2*: Partial-date types such as `year_month` and `month_day` can be created by not applying the second division operator for any of the three orders. For example:

```
year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
```

— *end note*]

4 [*Example 1*:

```
auto a = 2015/4/4;          // a == int(125)
auto b = 2015y/4/4;         // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;    // error: no viable operator/ for first /
auto d = 2015/April/4;      // error: no viable operator/ for first /
```

— *end example*]

```
constexpr year_month
  operator/(const year& y, const month& m) noexcept;
```

5 *Returns*: `{y, m}`.

```
constexpr year_month
  operator/(const year& y, int   m) noexcept;
```

6 *Returns*: `y / month(m)`.

```
constexpr month_day
  operator/(const month& m, const day& d) noexcept;
```

7 *Returns*: `{m, d}`.

©ISO/IEC 1991

```
constexpr month_day
  operator/(const month& m, int d) noexcept;
```

8 *Returns*: `m / day(d)`.

```
constexpr month_day
  operator/(int m, const day& d) noexcept;
```

9 *Returns*: `month(m) / d`.

```
constexpr month_day
  operator/(const day& d, const month& m) noexcept;
```

10 *Returns*: `m / d`.

```
constexpr month_day
  operator/(const day& d, int m) noexcept;
```

11 *Returns*: `month(m) / d`.

```
constexpr month_day_last
  operator/(const month& m, last_spec) noexcept;
```

12 *Returns*: `month_day_last{m}`.

```
constexpr month_day_last
  operator/(int m, last_spec) noexcept;
```

13 *Returns*: `month(m) / last`.

```
constexpr month_day_last
  operator/(last_spec, const month& m) noexcept;
```

14 *Returns*: `m / last`.

```
constexpr month_day_last
  operator/(last_spec, int m) noexcept;
```

15 *Returns*: `month(m) / last`.

```
constexpr month_weekday
  operator/(const month& m, const weekday_indexed& wdi) noexcept;
```

16 *Returns*: `{m, wdi}`.

```
constexpr month_weekday
  operator/(int m, const weekday_indexed& wdi) noexcept;
```

17 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, const month& m) noexcept;
```

18 *Returns*: `m / wdi`.

```
constexpr month_weekday
  operator/(const weekday_indexed& wdi, int m) noexcept;
```

19 *Returns*: `month(m) / wdi`.

```
constexpr month_weekday_last
  operator/(const month& m, const weekday_last& wdl) noexcept;
```

20 *Returns*: `{m, wdl}`.

```
constexpr month_weekday_last
  operator/(int m, const weekday_last& wdl) noexcept;
```

21 *Returns*: `month(m) / wdl`.

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, const month& m) noexcept;
```

22 *Returns*: `m / wdl`.

©ISO/IEC 1992

```
constexpr month_weekday_last
  operator/(const weekday_last& wdl, int m) noexcept;
```

23 *Returns*: `month(m) / wdl`.

```
constexpr year_month_day
  operator/(const year_month& ym, const day& d) noexcept;
```

24 *Returns*: `{ym.year(), ym.month(), d}`.

```
constexpr year_month_day
  operator/(const year_month& ym, int d) noexcept;
```

25 *Returns*: `ym / day(d)`.

```
constexpr year_month_day
  operator/(const year& y, const month_day& md) noexcept;
```

26 *Returns*: `y / md.month() / md.day()`.

```
constexpr year_month_day
  operator/(int y, const month_day& md) noexcept;
```

27 *Returns*: `year(y) / md`.

```
constexpr year_month_day
  operator/(const month_day& md, const year& y) noexcept;
```

28 *Returns*: `y / md`.

```
constexpr year_month_day
  operator/(const month_day& md, int y) noexcept;
```

29 *Returns*: `year(y) / md`.

```
constexpr year_month_day_last
  operator/(const year_month& ym, last_spec) noexcept;
```

30 *Returns*: `{ym.year(), month_day_last{ym.month()}}`.

```
constexpr year_month_day_last
  operator/(const year& y, const month_day_last& mdl) noexcept;
```

31 *Returns*: `{y, mdl}`.

```
constexpr year_month_day_last
  operator/(int y, const month_day_last& mdl) noexcept;
```

32 *Returns*: `year(y) / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, const year& y) noexcept;
```

33 *Returns*: `y / mdl`.

```
constexpr year_month_day_last
  operator/(const month_day_last& mdl, int y) noexcept;
```

34 *Returns*: `year(y) / mdl`.

```
constexpr year_month_weekday
  operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
```

35 *Returns*: `{ym.year(), ym.month(), wdi}`.

```
constexpr year_month_weekday
  operator/(const year& y, const month_weekday& mwd) noexcept;
```

36 *Returns*: `{y, mwd.month(), mwd.weekday_indexed()}`.

```
constexpr year_month_weekday
  operator/(int y, const month_weekday& mwd) noexcept;
```

37 *Returns*: `year(y) / mwd`.

©ISO/IEC 1993

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, const year& y) noexcept;
```

38 *Returns*: `y / mwd`.

```
constexpr year_month_weekday
  operator/(const month_weekday& mwd, int y) noexcept;
```

39 *Returns*: `year(y) / mwd`.

```
constexpr year_month_weekday_last
  operator/(const year_month& ym, const weekday_last& wdl) noexcept;
```

40 *Returns*: `{ym.year(), ym.month(), wdl}`.

```
constexpr year_month_weekday_last
  operator/(const year& y, const month_weekday_last& mwdl) noexcept;
```

41 *Returns*: `{y, mwdl.month(), mwdl.weekday_last()}`.

```
constexpr year_month_weekday_last
  operator/(int y, const month_weekday_last& mwdl) noexcept;
```

42 *Returns*: `year(y) / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, const year& y) noexcept;
```

43 *Returns*: `y / mwdl`.

```
constexpr year_month_weekday_last
  operator/(const month_weekday_last& mwdl, int y) noexcept;
```

44 *Returns*: `year(y) / mwdl`.

30.9 Class template `hh_mm_ss` [time.hms]

30.9.1 Overview [time.hms.overview]

```
namespace std::chrono {
  template<class Duration> class hh_mm_ss {
  public:
    static constexpr unsigned fractional_width = see below;
    using precision                            = see below;

    constexpr hh_mm_ss() noexcept : hh_mm_ss{Duration::zero()} {}
    constexpr explicit hh_mm_ss(Duration d);

    constexpr bool is_negative() const noexcept;
    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr precision subseconds() const noexcept;

    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;

  private:
    bool            is-neg;     // exposition only
    chrono::hours   h_;         // exposition only
    chrono::minutes m_;         // exposition only
    chrono::seconds s_;         // exposition only
    precision       ss_;        // exposition only
  };
}
```

1 The `hh_mm_ss` class template splits a `duration` into a multi-field time structure *hours*:*minutes*:*seconds* and possibly *subseconds*, where *subseconds* will be a duration unit based on a non-positive power of 10. The `Duration` template parameter dictates the precision to which the time is split. A `hh_mm_ss` models negative durations with a distinct `is_negative` getter that returns `true` when the input duration is negative. The

©ISO/IEC 1994

individual duration fields always return non-negative durations even when `is_negative()` indicates the structure is representing a negative duration.

2 If `Duration` is not a specialization of `duration`, the program is ill-formed.

30.9.2 Members [time.hms.members]

```
static constexpr unsigned fractional_width = see below;
```

1 `fractional_width` is the number of fractional decimal digits represented by `precision`. `fractional_width` has the value of the smallest possible integer in the range $[0, 18]$ such that `precision` will exactly represent all values of `Duration`. If no such value of `fractional_width` exists, then `fractional_width` is 6.

[*Example 1*: See Table 132 for some durations, the resulting `fractional_width`, and the formatted fractional second output of `Duration{1}`.

Table 132 — Examples for `fractional_width` [tab:time.hms.width]

Duration	`fractional_width`	Formatted fractional second output
`hours`, `minutes`, and `seconds`	0	
`milliseconds`	3	0.001
`microseconds`	6	0.000001
`nanoseconds`	9	0.000000001
`duration<int, ratio<1, 2>>`	1	0.5
`duration<int, ratio<1, 3>>`	6	0.333333
`duration<int, ratio<1, 4>>`	2	0.25
`duration<int, ratio<1, 5>>`	1	0.2
`duration<int, ratio<1, 6>>`	6	0.166666
`duration<int, ratio<1, 7>>`	6	0.142857
`duration<int, ratio<1, 8>>`	3	0.125
`duration<int, ratio<1, 9>>`	6	0.111111
`duration<int, ratio<1, 10>>`	1	0.1
`duration<int, ratio<756, 625>>`	4	0.2096

— *end example*]

```
using precision = see below;
```

2 `precision` is

`duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10`$^{\texttt{fractional\_width}}$`>>`

```
constexpr explicit hh_mm_ss(Duration d);
```

3 *Effects*: Constructs an object of type `hh_mm_ss` which represents the `Duration d` with precision `precision`.

(3.1) — Initializes *`is-neg`* with `d < Duration::zero()`. Let *`ABS_D`* represent `-d` if *`is-neg`* is `true` and `d` otherwise.

(3.2) — Initializes *`h_`* with `duration_cast<chrono::hours>(`*`ABS_D`*`)`.

(3.3) — Initializes *`m_`* with `duration_cast<chrono::minutes>(`*`ABS_D`*` - hours())`.

(3.4) — Initializes *`s_`* with `duration_cast<chrono::seconds>(`*`ABS_D`*` - hours() - minutes())`.

(3.5) — If `treat_as_floating_point_v<precision::rep>` is `true`, initializes *`ss_`* with *`ABS_D`* `- hours() - minutes() - seconds()`. Otherwise, initializes *`ss_`* with `duration_cast<precision>(`*`ABS_D`*` - hours() - minutes() - seconds())`.

[*Note 1*: When `precision::rep` is integral and `precision::period` is `ratio<1>`, `subseconds()` always returns a value equal to `0s`. — *end note*]

4 *Postconditions*: If `treat_as_floating_point_v<precision::rep>` is `true`, `to_duration()` returns `d`, otherwise `to_duration()` returns `duration_cast<precision>(d)`.

```
constexpr bool is_negative() const noexcept;
```

5 *Returns*: *`is-neg`*.

©ISO/IEC 1995

```
constexpr chrono::hours hours() const noexcept;
```

6 *Returns*: *h_*.

```
constexpr chrono::minutes minutes() const noexcept;
```

7 *Returns*: *m_*.

```
constexpr chrono::seconds seconds() const noexcept;
```

8 *Returns*: *s_*.

```
constexpr precision subseconds() const noexcept;
```

9 *Returns*: *ss_*.

```
constexpr precision to_duration() const noexcept;
```

10 *Returns*: If *is-neg*, returns `-(`*h_* `+` *m_* `+` *s_* `+` *ss_*`)`, otherwise returns *h_* `+` *m_* `+` *s_* `+` *ss_*.

```
constexpr explicit operator precision() const noexcept;
```

11 *Returns*: `to_duration()`.

30.9.3 Non-members [time.hms.nonmembers]

```
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);
```

1 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

2 [*Example 1*:

```
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
  hh_mm_ss hms{ms};
  cout << hms << '\n';
}
cout << hh_mm_ss{65745s} << '\n';
```

Produces the output (assuming the "C" locale):

```
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
```

— *end example*]

30.10 12/24 hours functions [time.12]

1 These functions aid in translating between a 12h format time of day and a 24h format time of day.

```
constexpr bool is_am(const hours& h) noexcept;
```

2 *Returns*: `0h <= h && h <= 11h`.

```
constexpr bool is_pm(const hours& h) noexcept;
```

3 *Returns*: `12h <= h && h <= 23h`.

```
constexpr hours make12(const hours& h) noexcept;
```

4 *Returns*: The 12-hour equivalent of `h` in the range [`1h`, `12h`]. If `h` is not in the range [`0h`, `23h`], the value returned is unspecified.

```
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

5 *Returns*: If `is_pm` is `false`, returns the 24-hour equivalent of `h` in the range [`0h`, `11h`], assuming `h` represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of `h` in the range [`12h`, `23h`], assuming `h` represents a post meridiem hour. If `h` is not in the range [`1h`, `12h`], the value returned is unspecified.

©ISO/IEC 1996

30.11 Time zones [time.zone]

30.11.1 General [time.zone.general]

1 30.11 describes an interface for accessing the IANA Time Zone Database[10] that interoperates with `sys_time` and `local_time`. This interface provides time zone support to both the civil calendar types (30.8) and to user-defined calendars.

30.11.2 Time zone database [time.zone.db]

30.11.2.1 Class `tzdb` [time.zone.db.tzdb]

```
namespace std::chrono {
  struct tzdb {
    string                 version;
    vector<time_zone>      zones;
    vector<time_zone_link> links;
    vector<leap_second>    leap_seconds;

    const time_zone* locate_zone(string_view tz_name) const;
    const time_zone* current_zone() const;
  };
}
```

1 Each `vector` in a `tzdb` object is sorted to enable fast lookup.

```
const time_zone* locate_zone(string_view tz_name) const;
```

2 *Returns*:

(2.1) — If `zones` contains an element `tz` for which `tz.name() == tz_name`, a pointer to `tz`;

(2.2) — otherwise, if `links` contains an element `tz_l` for which `tz_l.name() == tz_name`, then a pointer to the element `tz` of `zones` for which `tz.name() == tz_l.target()`.

[*Note 1*: A `time_zone_link` specifies an alternative name for a `time_zone`. — *end note*]

3 *Throws*: If a `const time_zone*` cannot be found as described in the *Returns*: element, throws a `runtime_error`.

[*Note 2*: On non-exceptional return, the return value is always a pointer to a valid `time_zone`. — *end note*]

```
const time_zone* current_zone() const;
```

4 *Returns*: A pointer to the time zone which the computer has set as its local time zone.

30.11.2.2 Class `tzdb_list` [time.zone.db.list]

```
namespace std::chrono {
  class tzdb_list {
  public:
    tzdb_list(const tzdb_list&) = delete;
    tzdb_list& operator=(const tzdb_list&) = delete;

    // unspecified additional constructors

    class const_iterator;

    const tzdb& front() const noexcept;

    const_iterator erase_after(const_iterator p);

    const_iterator begin() const noexcept;
    const_iterator end()   const noexcept;

    const_iterator cbegin() const noexcept;
    const_iterator cend()   const noexcept;
  };
}
```

1 The `tzdb_list` database is a singleton; the unique object of type `tzdb_list` can be accessed via the `get_tzdb_list()` function.

©ISO/IEC 1997

[*Note 1*: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the `front()` of this list via the read-only namespace scope functions `get_tzdb()`, `locate_zone()`, and `current_zone()`. — *end note*]

The `tzdb_list` object contains a list of `tzdb` objects.

2 `tzdb_list::const_iterator` is a constant iterator which meets the *Cpp17ForwardIterator* requirements and has a value type of `tzdb`.

```
const tzdb& front() const noexcept;
```

3 *Synchronization*: This operation is thread-safe with respect to `reload_tzdb()`.

[*Note 2*: `reload_tzdb()` pushes a new `tzdb` onto the front of this container. — *end note*]

4 *Returns*: A reference to the first `tzdb` in the container.

```
const_iterator erase_after(const_iterator p);
```

5 *Preconditions*: The iterator following `p` is dereferenceable.

6 *Effects*: Erases the `tzdb` referred to by the iterator following `p`.

7 *Postconditions*: No pointers, references, or iterators are invalidated except those referring to the erased `tzdb`.

[*Note 3*: It is not possible to erase the `tzdb` referred to by `begin()`. — *end note*]

8 *Returns*: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

9 *Throws*: Nothing.

```
const_iterator begin() const noexcept;
```

10 *Returns*: An iterator referring to the first `tzdb` in the container.

```
const_iterator end() const noexcept;
```

11 *Returns*: An iterator referring to the position one past the last `tzdb` in the container.

```
const_iterator cbegin() const noexcept;
```

12 *Returns*: `begin()`.

```
const_iterator cend() const noexcept;
```

13 *Returns*: `end()`.

30.11.2.3 Time zone database access [time.zone.db.access]

```
tzdb_list& get_tzdb_list();
```

1 *Effects*: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.

2 *Synchronization*: It is safe to call this function from multiple threads at one time.

3 *Returns*: A reference to the database.

4 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`s.

```
const tzdb& get_tzdb();
```

5 *Returns*: `get_tzdb_list().front()`.

```
const time_zone* locate_zone(string_view tz_name);
```

6 *Returns*: `get_tzdb().locate_zone(tz_name)`.

7 [*Note 1*: The time zone database will be initialized if this is the first reference to the database. — *end note*]

```
const time_zone* current_zone();
```

8 *Returns*: `get_tzdb().current_zone()`.

©ISO/IEC 1998

30.11.2.4 Remote time zone database support [time.zone.db.remote]

1 The local time zone database is that supplied by the implementation when the program first accesses the database, for example via `current_zone()`. While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the *remote time zone database*.

```
const tzdb& reload_tzdb();
```

2 *Effects*: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.

3 *Synchronization*: This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.

4 *Postconditions*: No pointers, references, or iterators are invalidated.

5 *Returns*: `get_tzdb_list().front()`.

6 *Throws*: `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```
string remote_version();
```

7 *Returns*: The latest remote database version.

[*Note 1*: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — *end note*]

30.11.3 Exception classes [time.zone.exception]

30.11.3.1 Class `nonexistent_local_time` [time.zone.exception.nonexist]

```
namespace std::chrono {
  class nonexistent_local_time : public runtime_error {
  public:
    template<class Duration>
      nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `nonexistent_local_time` is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::nonexistent` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is in a gap between\n"
   << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ' '
   << i.first.abbrev << " and\n"
   << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ' '
   << i.second.abbrev
   << " which are both equivalent to\n"
   << i.first.end << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[2]/March/2016} + 2h + 30min};
```

©ISO/IEC 1999

```
  } catch (const nonexistent_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC
```

— *end example*]

30.11.3.2 Class `ambiguous_local_time` [time.zone.exception.ambig]

```
namespace std::chrono {
  class ambiguous_local_time : public runtime_error {
  public:
    template<class Duration>
      ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
  };
}
```

1 `ambiguous_local_time` is thrown when an attempt is made to convert an ambiguous `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`.

```
template<class Duration>
  ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
```

2 *Preconditions*: `i.result == local_info::ambiguous` is `true`.

3 *Effects*: Initializes the base class with a sequence of `char` equivalent to that produced by `os.str()` initialized as shown below:

```
ostringstream os;
os << tp << " is ambiguous.  It could be\n"
   << tp << ' ' << i.first.abbrev << " == "
   << tp - i.first.offset << " UTC or\n"
   << tp << ' ' << i.second.abbrev  << " == "
   << tp - i.second.offset  << " UTC";
```

4 [*Example 1*:

```
#include <chrono>
#include <iostream>

int main() {
  using namespace std::chrono;
  try {
    auto zt = zoned_time{"America/New_York",
                         local_days{Sunday[1]/November/2016} + 1h + 30min};
  } catch (const ambiguous_local_time& e) {
    std::cout << e.what() << '\n';
  }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous.  It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

— *end example*]

30.11.4 Information classes [time.zone.info]

30.11.4.1 Class `sys_info` [time.zone.info.sys]

```
namespace std::chrono {
  struct sys_info {
    sys_seconds begin;
```

©ISO/IEC 2000

```
    sys_seconds end;
    seconds     offset;
    minutes     save;
    string      abbrev;
  };
}
```

1 A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

2 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. — *end note*]

3 The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range [`begin`, `end`). This information can be used to efficiently iterate the transitions of a `time_zone`.

4 The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

5 The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save != 0min`, this `sys_info` is said to be on "daylight saving" time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range [`begin`, `end`) (if `save != 0min` for this `sys_info`).

6 The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

7 *Effects*: Streams out the `sys_info` object `r` in an unspecified format.

8 *Returns*: `os`.

30.11.4.2 Class `local_info` [time.zone.info.local]

```
namespace std::chrono {
  struct local_info {
    static constexpr int unique      = 0;
    static constexpr int nonexistent = 1;
    static constexpr int ambiguous   = 2;

    int result;
    sys_info first;
    sys_info second;
  };
}
```

1 [*Note 1*: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — *end note*]

2 Describes the result of converting a `local_time` to a `sys_time` as follows:

(2.1) — When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

(2.2) — If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.

(2.3) — If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

©ISO/IEC 2001

```
template<class charT, class traits>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

3 *Effects*: Streams out the `local_info` object `r` in an unspecified format.

4 *Returns*: `os`.

30.11.5 Class `time_zone` [time.zone.timezone]

30.11.5.1 Overview [time.zone.overview]

```
namespace std::chrono {
  class time_zone {
  public:
    time_zone(time_zone&&) = default;
    time_zone& operator=(time_zone&&) = default;

    // unspecified additional constructors

    string_view name() const noexcept;

    template<class Duration> sys_info   get_info(const sys_time<Duration>& st)   const;
    template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp) const;

    template<class Duration>
      sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp, choose z) const;

    template<class Duration>
      local_time<common_type_t<Duration, seconds>>
        to_local(const sys_time<Duration>& tp) const;
  };
}
```

1 A `time_zone` represents all time zone transitions for a specific geographic area. `time_zone` construction is unspecified, and performed as part of database initialization.

[*Note 1*: `const time_zone` objects can be accessed via functions such as `locate_zone`. — *end note*]

30.11.5.2 Member functions [time.zone.members]

```
string_view name() const noexcept;
```

1 *Returns*: The name of the `time_zone`.

2 [*Example 1*: `"America/New_York"`. — *end example*]

```
template<class Duration>
  sys_info get_info(const sys_time<Duration>& st) const;
```

3 *Returns*: A `sys_info i` for which `st` is in the range [`i.begin`, `i.end`).

```
template<class Duration>
  local_info get_info(const local_time<Duration>& tp) const;
```

4 *Returns*: A `local_info` for `tp`.

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp) const;
```

5 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`.

6 *Throws*: If the conversion from `tp` to a `sys_time` is ambiguous, throws `ambiguous_local_time`. If the `tp` represents a non-existent time between two UTC `time_points`, throws `nonexistent_local_time`.

©ISO/IEC 2002

```
template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;
```

7 *Returns*: A `sys_time` that is at least as fine as `seconds`, and will be finer if the argument `tp` has finer precision. This `sys_time` is the UTC equivalent of `tp` according to the rules of this `time_zone`. If the conversion from `tp` to a `sys_time` is ambiguous, returns the earlier `sys_time` if `z == choose::earliest`, and returns the later `sys_time` if `z == choose::latest`. If the `tp` represents a non-existent time between two UTC `time_points`, then the two UTC `time_points` will be the same, and that UTC `time_point` will be returned.

```
template<class Duration>
  local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;
```

8 *Returns*: The `local_time` associated with `tp` and this `time_zone`.

30.11.5.3 Non-member functions [time.zone.nonmembers]

```
bool operator==(const time_zone& x, const time_zone& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

```
strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

30.11.6 Class template `zoned_traits` [time.zone.zonedtraits]

```
namespace std::chrono {
  template<class T> struct zoned_traits {};
}
```

1 `zoned_traits` provides a means for customizing the behavior of `zoned_time<Duration, TimeZonePtr>` for the `zoned_time` default constructor, and constructors taking `string_view`. A specialization for `const time_zone*` is provided by the implementation:

```
namespace std::chrono {
  template<> struct zoned_traits<const time_zone*> {
    static const time_zone* default_zone();
    static const time_zone* locate_zone(string_view name);
  };
}
```

```
static const time_zone* default_zone();
```

2 *Returns*: `std::chrono::locate_zone("UTC")`.

```
static const time_zone* locate_zone(string_view name);
```

3 *Returns*: `std::chrono::locate_zone(name)`.

30.11.7 Class template `zoned_time` [time.zone.zonedtime]

30.11.7.1 Overview [time.zone.zonedtime.overview]

```
namespace std::chrono {
  template<class Duration, class TimeZonePtr = const time_zone*>
  class zoned_time {
  public:
    using duration = common_type_t<Duration, seconds>;

  private:
    TimeZonePtr        zone_;                    // exposition only
    sys_time<duration> tp_;                      // exposition only

    using traits_ = zoned_traits<TimeZonePtr>;  // exposition only

  public:
    zoned_time();
    zoned_time(const zoned_time&) = default;
```

©ISO/IEC 2003

```
  zoned_time& operator=(const zoned_time&) = default;

  zoned_time(const sys_time<Duration>& st);
  explicit zoned_time(TimeZonePtr z);
  explicit zoned_time(string_view name);

  template<class Duration2>
    zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);

  zoned_time(TimeZonePtr z,    const sys_time<Duration>& st);
  zoned_time(string_view name, const sys_time<Duration>& st);

  zoned_time(TimeZonePtr z,    const local_time<Duration>& tp);
  zoned_time(string_view name, const local_time<Duration>& tp);
  zoned_time(TimeZonePtr z,    const local_time<Duration>& tp, choose c);
  zoned_time(string_view name, const local_time<Duration>& tp, choose c);

  template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
  template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

  template<class Duration2, class TimeZonePtr2>

  zoned_time(TimeZonePtrOrName&&, sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>,
                  time-zone-representation<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
  zoned_time(TimeZonePtrOrName&&, local_time<Duration>,
             choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
```

©ISO/IEC 2004

```
                    time-zone-representation<TimeZonePtrOrName>>;

  template<class Duration, class TimeZonePtrOrName, class TimeZonePtr2>
    zoned_time(TimeZonePtrOrName&&, zoned_time<Duration, TimeZonePtr2>,
               choose = choose::earliest)
      -> zoned_time<common_type_t<Duration, seconds>,
                    time-zone-representation<TimeZonePtrOrName>>;
}
```

1 `zoned_time` represents a logical pairing of a `time_zone` and a `time_point` with precision `Duration`. `zoned_time<Duration>` maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2 If `Duration` is not a specialization of `chrono::duration`, the program is ill-formed.

3 Every constructor of `zoned_time` that accepts a `string_view` as its first parameter does not participate in class template argument deduction (12.2.2.9).

30.11.7.2 Constructors [time.zone.zonedtime.ctor]

```
zoned_time();
```

1 *Constraints*: *traits_*`::default_zone()` is a well-formed expression.

2 *Effects*: Initializes *zone_* with *traits_*`::default_zone()` and default constructs *tp_*.

```
zoned_time(const sys_time<Duration>& st);
```

3 *Constraints*: *traits_*`::default_zone()` is a well-formed expression.

4 *Effects*: Initializes *zone_* with *traits_*`::default_zone()` and *tp_* with `st`.

```
explicit zoned_time(TimeZonePtr z);
```

5 *Preconditions*: `z` refers to a time zone.

6 *Effects*: Initializes *zone_* with `std::move(z)` and default constructs *tp_*.

```
explicit zoned_time(string_view name);
```

7 *Constraints*: *traits_*`::locate_zone(string_view{})` is a well-formed expression and `zoned_time` is constructible from the return type of *traits_*`::locate_zone(string_view{})`.

8 *Effects*: Initializes *zone_* with *traits_*`::locate_zone(name)` and default constructs *tp_*.

```
template<class Duration2>
  zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
```

9 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

10 *Effects*: Initializes *zone_* with `y.`*zone_* and *tp_* with `y.`*tp_*.

```
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

11 *Preconditions*: `z` refers to a time zone.

12 *Effects*: Initializes *zone_* with `std::move(z)` and *tp_* with `st`.

```
zoned_time(string_view name, const sys_time<Duration>& st);
```

13 *Constraints*: `zoned_time` is constructible from the return type of *traits_*`::locate_zone(name)` and `st`.

14 *Effects*: Equivalent to construction with {*traits_*`::locate_zone(name), st}`.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

15 *Constraints*:

```
  is_convertible_v<
    decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{})),
    sys_time<duration>>
```

is `true`.

16 *Preconditions*: `z` refers to a time zone.

©ISO/IEC 2005

17 *Effects*: Initializes *zone_* with `std::move(z)` and *tp_* with *zone_*`->to_sys(tp)`.

```
zoned_time(string_view name, const local_time<Duration>& tp);
```

18 *Constraints*: `zoned_time` is constructible from the return type of *traits_*`::locate_zone(name)` and `tp`.

19 *Effects*: Equivalent to construction with {*traits_*`::locate_zone(name), tp`}.

```
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

20 *Constraints*:

```
is_convertible_v<
  decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest)),
  sys_time<duration>>
```

is `true`.

21 *Preconditions*: `z` refers to a time zone.

22 *Effects*: Initializes *zone_* with `std::move(z)` and *tp_* with *zone_*`->to_sys(tp, c)`.

```
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

23 *Constraints*: `zoned_time` is constructible from the return type of *traits_*`::locate_zone(name)`, `local_time<Duration>`, and `choose`.

24 *Effects*: Equivalent to construction with {*traits_*`::locate_zone(name), tp, c`}.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

25 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

26 *Preconditions*: `z` refers to a valid time zone.

27 *Effects*: Initializes *zone_* with `std::move(z)` and *tp_* with `y.`*tp_*.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

28 *Constraints*: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is `true`.

29 *Preconditions*: `z` refers to a valid time zone.

30 *Effects*: Equivalent to construction with {`z, y`}.

31 [*Note 1*: The `choose` parameter has no effect. — *end note*]

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

32 *Constraints*: `zoned_time` is constructible from the return type of *traits_*`::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

33 *Effects*: Equivalent to construction with {*traits_*`::locate_zone(name), y`}.

```
template<class Duration2, class TimeZonePtr2>
  zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);
```

34 *Constraints*: `zoned_time` is constructible from the return type of *traits_*`::locate_zone(name)`, the type `zoned_time<Duration2, TimeZonePtr2>`, and the type `choose`.

35 *Effects*: Equivalent to construction with {*traits_*`::locate_zone(name), y, c`}.

36 [*Note 2*: The `choose` parameter has no effect. — *end note*]

30.11.7.3 Member functions [time.zone.zonedtime.members]

```
zoned_time& operator=(const sys_time<Duration>& st);
```

1 *Effects*: After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

2 *Returns*: `*this`.

©ISO/IEC 2006

```
zoned_time& operator=(const local_time<Duration>& lt);
```

3 *Effects*: After assignment, `get_local_time() == lt`. This assignment has no effect on the return value of `get_time_zone()`.

4 *Returns*: `*this`.

```
operator sys_time<duration>() const;
```

5 *Returns*: `get_sys_time()`.

```
explicit operator local_time<duration>() const;
```

6 *Returns*: `get_local_time()`.

```
TimeZonePtr get_time_zone() const;
```

7 *Returns*: *zone_*.

```
local_time<duration> get_local_time() const;
```

8 *Returns*: *zone_*->to_local(*tp_*).

```
sys_time<duration> get_sys_time() const;
```

9 *Returns*: *tp_*.

```
sys_info get_info() const;
```

10 *Returns*: *zone_*->get_info(*tp_*).

30.11.7.4 Non-member functions [time.zone.zonedtime.nonmembers]

```
template<class Duration1, class Duration2, class TimeZonePtr>
  bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                  const zoned_time<Duration2, TimeZonePtr>& y);
```

1 *Returns*: `x.`*zone_* `== y.`*zone_* `&& x.`*tp_* `== y.`*tp_*.

```
template<class charT, class traits, class Duration, class TimeZonePtr>
  basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               const zoned_time<Duration, TimeZonePtr>& t);
```

2 *Effects*: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T %Z}"), t);
```

30.11.8 Class `leap_second` [time.zone.leap]

30.11.8.1 Overview [time.zone.leap.overview]

```
namespace std::chrono {
  class leap_second {
  public:
    leap_second(const leap_second&)            = default;
    leap_second& operator=(const leap_second&) = default;

    // unspecified additional constructors

    constexpr sys_seconds date() const noexcept;
    constexpr seconds value() const noexcept;
  };
}
```

1 Objects of type `leap_second` representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

2 [*Example 1*:

```
for (auto& l : get_tzdb().leap_seconds)
  if (l <= sys_days{2018y/March/17d})
    cout << l.date() << ": " << l.value() << '\n';
```

©ISO/IEC 2007

Produces the output:

```
1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s

2012-07-01 00:00:00: 1s
2015-07-01 00:00:00: 1s
2017-01-01 00:00:00: 1s
```

— *end example*]

30.11.8.2 Member functions [time.zone.leap.members]

```
constexpr sys_seconds date() const noexcept;
```

1 *Returns*: The date and time at which the leap second was inserted.

```
constexpr seconds value() const noexcept;
```

2 *Returns*: `+1s` to indicate a positive leap second or `-1s` to indicate a negative leap second.

[*Note 1*: All leap seconds inserted up through 2022 were positive leap seconds. — *end note*]

30.11.8.3 Non-member functions [time.zone.leap.nonmembers]

```
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

1 *Returns*: `x.date() == y.date()`.

```
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

2 *Returns*: `x.date() <=> y.date()`.

```
template<class Duration>
  constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

3 *Returns*: `x.date() == y`.

```
template<class Duration>
  constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

4 *Returns*: `x.date() < y`.

```
template<class Duration>
  constexpr bool operator<(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

5 *Returns*: `x < y.date()`.

©ISO/IEC 2008

```
template<class Duration>
  constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

6 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator>(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

7 *Returns*: `y < x`.

```
template<class Duration>
  constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

8 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator<=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

9 *Returns*: `!(y < x)`.

```
template<class Duration>
  constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

10 *Returns*: `!(x < y)`.

```
template<class Duration>
  constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;
```

11 *Returns*: `!(x < y)`.

```
template<class Duration>
  requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
  constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

12 *Returns*: `x.date() <=> y`.

30.11.9 Class `time_zone_link` [time.zone.link]

30.11.9.1 Overview [time.zone.link.overview]

```
namespace std::chrono {
  class time_zone_link {
  public:
    time_zone_link(time_zone_link&&)            = default;
    time_zone_link& operator=(time_zone_link&&) = default;

    // unspecified additional constructors

    string_view name()   const noexcept;
    string_view target() const noexcept;
  };
}
```

1 A `time_zone_link` specifies an alternative name for a `time_zone`. `time_zone_link`s are constructed when the time zone database is initialized.

30.11.9.2 Member functions [time.zone.link.members]

```
string_view name() const noexcept;
```

1 *Returns*: The alternative name for the time zone.

```
string_view target() const noexcept;
```

2 *Returns*: The name of the `time_zone` for which this `time_zone_link` provides an alternative name.

30.11.9.3 Non-member functions [time.zone.link.nonmembers]

```
bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;
```

1 *Returns*: `x.name() == y.name()`.

©ISO/IEC 2009

```
strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;
```

2 *Returns*: `x.name() <=> y.name()`.

30.12 Formatting [time.format]

1 Each `formatter` (28.5.6) specialization in the chrono library (30.2) meets the *Formatter* requirements (28.5.6.1). The `parse` member functions of these formatters interpret the format specification as a *chrono-format-spec* according to the following syntax:

chrono-format-spec:
fill-and-align$_{opt}$ *width*$_{opt}$ *precision*$_{opt}$ L$_{opt}$ *chrono-specs*$_{opt}$

chrono-specs:
conversion-spec
chrono-specs conversion-spec
chrono-specs literal-char

literal-char:
any character other than `{`, `}`, or `%`

conversion-spec:
`%` *modifier*$_{opt}$ *type*

modifier: one of
`E O`

type: one of
`a A b B c C d D e F g G h H I j m M n`
`p q Q r R S t T u U V w W x X y Y z Z %`

The productions *fill-and-align*, *width*, and *precision* are described in 28.5.2. Giving a *precision* specification in the *chrono-format-spec* is valid only for types that are specializations of `std::chrono::duration` for which the nested *typedef-name* `rep` denotes a floating-point type. For all other types, an exception of type `format_error` is thrown if the *chrono-format-spec* contains a *precision* specification. All ordinary multibyte characters represented by *literal-char* are copied unchanged to the output.

2 A *formatting locale* is an instance of `locale` used by a formatting function, defined as

(2.1) — the `"C"` locale if the `L` option is not present in *chrono-format-spec*, otherwise

(2.2) — the locale passed to the formatting function if any, otherwise

(2.3) — the global locale.

3 Each conversion specifier *conversion-spec* is replaced by appropriate characters as described in Table 133; the formats specified in ISO 8601-1:2019 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.

4 The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is `true`, is equivalent to the output of the corresponding positive value, with a *`STATICALLY-WIDEN`*`<charT>("-")` character sequence placed before the replacement of the initial conversion specifier.

[*Example 1*:

```
cout << format("{:%T}", -10'000s);          // prints: -02:46:40
cout << format("{:%H:%M:%S}", -10'000s);    // prints: -02:46:40
cout << format("minutes {:%M, hours %H, seconds %S}", -10'000s);
                                            // prints: minutes -46, hours 02, seconds 40
```

— *end example*]

5 Unless explicitly requested, the result of formatting a chrono type does not contain time zone abbreviation and time zone offset information. If the information is available, the conversion specifiers `%Z` and `%z` will format this information (respectively).

[*Note 1*: If the information is not available and a `%Z` or `%z` conversion specifier appears in the *chrono-format-spec*, an exception of type `format_error` is thrown, as described above. — *end note*]

©ISO/IEC 2010

6 If the type being formatted does not contain the information that the format flag needs, an exception of type `format_error` is thrown.

[*Example 2*: A `duration` does not contain enough information to format as a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 133 — Meaning of conversion specifiers [tab:time.format.spec]

Specifier	Replacement
`%a`	The locale's abbreviated weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%A`	The locale's full weekday name. If the value does not contain a valid weekday, an exception of type `format_error` is thrown.
`%b`	The locale's abbreviated month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%B`	The locale's full month name. If the value does not contain a valid month, an exception of type `format_error` is thrown.
`%c`	The locale's date and time representation. The modified command `%Ec` produces the locale's alternate date and time representation.
`%C`	The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%EC` produces the locale's alternative representation of the century.
`%d`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with `0`. The modified command `%Od` produces the locale's alternative representation.
`%D`	Equivalent to `%m/%d/%y`.
`%e`	The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command `%Oe` produces the locale's alternative representation.
`%F`	Equivalent to `%Y-%m-%d`.
`%g`	The last two decimal digits of the calendar year as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit it is prefixed by `0`.
`%G`	The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is less than four digits it is left-padded with `0` to four digits.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OH` produces the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OI` produces the locale's alternative representation.
`%j`	If the type being formatted is a specialization of `duration`, the decimal number of `days` without padding. Otherwise, the day of the year as a decimal number. January 1 is `001`. If the result is less than three digits, it is left-padded with `0` to three digits.
`%m`	The month as a decimal number. Jan is `01`. If the result is a single digit, it is prefixed with `0`. The modified command `%Om` produces the locale's alternative representation.
`%M`	The minute as a decimal number. If the result is a single digit, it is prefixed with `0`. The modified command `%OM` produces the locale's alternative representation.
`%n`	A new-line character.
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%q`	The duration's unit suffix as specified in 30.5.11.
`%Q`	The duration's numeric value (as if extracted via `.count()`).
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.

©ISO/IEC 2011

Table 133 — Meaning of conversion specifiers (continued)

Specifier	Replacement
%S	Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %OS produces the locale's alternative representation.
%t	A horizontal-tab character.
%T	Equivalent to %H:%M:%S.
%u	The calendar day of week as a decimal number (1-7), as specified in ISO 8601-1:2019, where Monday is 1. The modified command %Ou produces the locale's alternative representation.
%U	The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale's alternative representation.
%V	The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale's alternative representation.
%w	The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale's alternative representation.
%W	The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OW produces the locale's alternative representation.
%x	The locale's date representation. The modified command %Ex produces the locale's alternate date representation.
%X	The locale's time representation. The modified command %EX produces the locale's alternate time representation.
%y	The last two decimal digits of the year, regardless of the sign of the year. If the result is a single digit, it is prefixed by 0. The modified command %Oy produces the locale's alternative representation. The modified command %Ey produces the locale's alternative representation of offset from %EC (year only). [*Example 3*: `cout << format("{:%C %y}", -1976y);  // prints -20 76` — *end example*]
%Y	The year as a decimal number. If the result is less than four digits, it is left-padded with 0 to four digits. The modified command %EY produces the locale's alternative full year representation.
%z	The offset from UTC as specified in ISO 8601-1:2019, 5.3.4.1. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %Oz insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type format_error is thrown.
%Z	The time zone abbreviation. If the time zone abbreviation is not available, an exception of type format_error is thrown.
%%	A % character.

7 Unless otherwise specified, if the *chrono-specs* is omitted, the chrono object is formatted as if by streaming it to `basic_ostringstream<charT> os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[*Example 4*:

```
string s = format("{:=>8}", 42ms);      // value of s is "====42ms"
```

— *end example*]

©ISO/IEC 2012

8 For `chrono::duration` the library only provides the following specialization of `enable_nonlocking_formatter_optimization`:

```
template<class Rep, class Period>
  constexpr bool enable_nonlocking_formatter_optimization<
    chrono::duration<Rep, Period>> =
      enable_nonlocking_formatter_optimization<Rep>;
```

9 For `chrono::zoned_time` the library only provides the following specialization of `enable_nonlocking_formatter_optimization`:

```
template<class Duration>
  constexpr bool enable_nonlocking_formatter_optimization<
    chrono::zoned_time<Duration, const std::chrono::time_zone*>> = true;
```

```
template<class Duration, class charT>
  struct formatter<chrono::sys_time<Duration>, charT>;
```

10 *Remarks*: If `%Z` is used, it is replaced with *STATICALLY-WIDEN*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted.

```
template<class Duration, class charT>
  struct formatter<chrono::utc_time<Duration>, charT>;
```

11 *Remarks*: If `%Z` is used, it is replaced with *STATICALLY-WIDEN*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is *STATICALLY-WIDEN*`<charT>("60")`.

```
template<class Duration, class charT>
  struct formatter<chrono::tai_time<Duration>, charT>;
```

12 *Remarks*: If `%Z` is used, it is replaced with *STATICALLY-WIDEN*`<charT>("TAI")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} -
  (sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::gps_time<Duration>, charT>;
```

13 *Remarks*: If `%Z` is used, it is replaced with *STATICALLY-WIDEN*`<charT>("GPS")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
  (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

```
template<class Duration, class charT>
  struct formatter<chrono::file_time<Duration>, charT>;
```

14 *Remarks*: If `%Z` is used, it is replaced with *STATICALLY-WIDEN*`<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of `0min` is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `clock_cast<system_clock>(t)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(t)`, where `t` is the first argument to `format`.

```
template<class Duration, class charT>
  struct formatter<chrono::local_time<Duration>, charT>;
```

15 *Remarks*: If `%Z`, `%z`, or a modified version of `%z` is used, an exception of type `format_error` is thrown.

```
template<class Duration> struct local-time-format-t {          // exposition only
  local_time<Duration> time_;                                  // exposition only
  const string* abbrev_;                                       // exposition only
  const seconds* offset-sec;                                   // exposition only
};
```

©ISO/IEC 2013

```
template<class Duration>
  local-time-format-t<Duration>
    local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
                      const seconds* offset_sec = nullptr);
```

16 *Returns*: {time, abbrev, offset_sec}.

```
template<class Duration, class charT>
  struct formatter<chrono::local-time-format-t<Duration>, charT>;
```

17 Let f be a *local-time-format-t*<Duration> object passed to formatter::format.

18 *Remarks*: If the *chrono-specs* is omitted, the result is equivalent to using %F %T %Z as the *chrono-specs*. If %Z is used, it is replaced with *f.*abbrev_ if f.*abbrev_* is not a null pointer value. If %Z is used and f.*abbrev_* is a null pointer value, an exception of type format_error is thrown. If %z (or a modified variant of %z) is used, it is formatted with the value of *f.*offset-sec* if f.*offset-sec* is not a null pointer value. If %z (or a modified variant of %z) is used and f.*offset-sec* is a null pointer value, then an exception of type format_error is thrown.

```
  template<class Duration, class TimeZonePtr, class charT>
  struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
      : formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT> {
    template<class FormatContext>
      typename FormatContext::iterator
        format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
  };

template<class FormatContext>
  typename FormatContext::iterator
    format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
```

19 *Effects*: Equivalent to:

```
sys_info info = tp.get_info();
return formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT>::
         format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);
```

30.13 Parsing [time.parse]

1 Each parse overload specified in this subclause calls from_stream unqualified, so as to enable argument-dependent lookup (6.5.4). In the following paragraphs, let is denote an object of type basic_istream<charT, traits> and let I be basic_istream<charT, traits>&, where charT and traits are template parameters in that context.

2 *Recommended practice*: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by parse immovable and preventing stream extraction into an lvalue of such a manipulator type.

```
template<class charT, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

3 Let F be fmt for the first overload and fmt.c_str() for the second overload. Let traits be char_traits<charT> for the first overload.

4 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

is well-formed when treated as an unevaluated operand (7.2.3).

5 *Returns*: A manipulator such that the expression is >> parse(fmt, tp) has type I, has value is, and calls from_stream(is, F, tp).

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
```

©ISO/IEC 2014

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev);
```

6 Let *F* be `fmt` for the first overload and `fmt.c_str()` for the second overload.

7 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand (7.2.3).

8 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev))`.

```
template<class charT, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          minutes& offset);
```

9 Let *F* be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

10 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp,
            declval<basic_string<charT, traits, Alloc>*>(),
            &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

11 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
from_stream(is,
            F, tp,
            static_cast<basic_string<charT, traits, Alloc>*>(nullptr),
            &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const charT* fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
    parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
          basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

12 Let *F* be `fmt` for the first overload and `fmt.c_str()` for the second overload.

13 *Constraints*: The expression

```
from_stream(declval<basic_istream<charT, traits>&>(),
            F, tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

14 *Returns*: A manipulator such that the expression `is >> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is, F, tp, addressof(abbrev), &offset)`.

15 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to Table 134. Some flags can be modified by a width parameter given as a positive decimal integer called out as *N* below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 134, except for

©ISO/IEC 2015

whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

16 If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

[*Example 1*: A `duration` cannot represent a `weekday`. — *end example*]

However, if a flag refers to a "time of day" (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

17 If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

Table 134 — Meaning of `parse` flags [tab:time.parse.spec]

Flag	Parsed value
`%a`	The locale's full or abbreviated case-insensitive weekday name.
`%A`	Equivalent to `%a`.
`%b`	The locale's full or abbreviated case-insensitive month name.
`%B`	Equivalent to `%b`.
`%c`	The locale's date and time representation. The modified command `%Ec` interprets the locale's alternate date and time representation.
`%C`	The century as a decimal number. The modified command `%`*N*`C` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%EC` interprets the locale's alternative representation of the century.
`%d`	The day of the month as a decimal number. The modified command `%`*N*`d` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Od` interprets the locale's alternative representation of the day of the month.
`%D`	Equivalent to `%m/%d/%y`.
`%e`	Equivalent to `%d` and can be modified like `%d`.
`%F`	Equivalent to `%Y-%m-%d`. If modified with a width *N*, the width is applied to only `%Y`.
`%g`	The last two decimal digits of the calendar year, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%`*N*`g` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required.
`%G`	The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%`*N*`G` specifies the maximum number of characters to read. If *N* is not specified, the default is 4. Leading zeroes are permitted but not required.
`%h`	Equivalent to `%b`.
`%H`	The hour (24-hour clock) as a decimal number. The modified command `%`*N*`H` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OH` interprets the locale's alternative representation.
`%I`	The hour (12-hour clock) as a decimal number. The modified command `%`*N*`I` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OI` interprets the locale's alternative representation.
`%j`	If the type being parsed is a specialization of `duration`, a decimal number of `days`. Otherwise, the day of the year as a decimal number. January 1 is `1`. In either case, the modified command `%`*N*`j` specifies the maximum number of characters to read. If *N* is not specified, the default is 3. Leading zeroes are permitted but not required.
`%m`	The month as a decimal number. January is `1`. The modified command `%`*N*`m` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%Om` interprets the locale's alternative representation.

©ISO/IEC 2016

Table 134 — Meaning of `parse` flags (continued)

Flag	Parsed value
`%M`	The minutes as a decimal number. The modified command `%`*`N`*`M` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OM` interprets the locale's alternative representation.
`%n`	Matches one whitespace character. [*Note 1*: `%n`, `%t`, and a space can be combined to match a wide range of whitespace patterns. For example, `"%n "` matches one or more whitespace characters, and `"%n%t%t"` matches one to three whitespace characters. — *end note*]
`%p`	The locale's equivalent of the AM/PM designations associated with a 12-hour clock.
`%r`	The locale's 12-hour clock time.
`%R`	Equivalent to `%H:%M`.
`%S`	The seconds as a decimal number. The modified command `%`*`N`*`S` specifies the maximum number of characters to read. If *N* is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a `long double` in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command `%OS` interprets the locale's alternative representation.
`%t`	Matches zero or one whitespace characters.
`%T`	Equivalent to `%H:%M:%S`.
`%u`	The calendar day of week as a decimal number (`1`-`7`), as specified in ISO 8601-1:2019, where Monday is `1`. The modified command `%`*`N`*`u` specifies the maximum number of characters to read. If *N* is not specified, the default is `1`. Leading zeroes are permitted but not required.
`%U`	The week number of the year as a decimal number. The first Sunday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%`*`N`*`U` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OU` interprets the locale's alternative representation.
`%V`	The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command `%`*`N`*`V` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required.
`%w`	The weekday as a decimal number (`0`-`6`), where Sunday is `0`. The modified command `%`*`N`*`w` specifies the maximum number of characters to read. If *N* is not specified, the default is `1`. Leading zeroes are permitted but not required. The modified command `%Ow` interprets the locale's alternative representation.
`%W`	The week number of the year as a decimal number. The first Monday of the year is the first day of week `01`. Days of the same year prior to that are in week `00`. The modified command `%`*`N`*`W` specifies the maximum number of characters to read. If *N* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OW` interprets the locale's alternative representation.
`%x`	The locale's date representation. The modified command `%Ex` interprets the locale's alternate date representation.
`%X`	The locale's time representation. The modified command `%EX` interprets the locale's alternate time representation.

©ISO/IEC 2017

Table 134 — Meaning of `parse` flags (continued)

Flag	Parsed value
`%y`	The last two decimal digits of the year, regardless of the sign of the year. If the century is not otherwise specified (e.g., with `%C`), values in the range [`69`, `99`] are presumed to refer to the years 1969 to 1999, and values in the range [`00`, `68`] are presumed to refer to the years 2000 to 2068. The modified command `%`*`N`*`y` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands `%Ey` and `%Oy` interpret the locale's alternative representation. [*Example 2*: `year y;` `istringstream{"-20 76"} >> parse("%3C %y", y);  // y == -1976y` *is* `true` — *end example*]
`%Y`	The year as a decimal number. The modified command `%`*`N`*`Y` specifies the maximum number of characters to read. If *`N`* is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command `%EY` interprets the locale's alternative representation.
`%z`	The offset from UTC in the format `[+|-]hh[mm]`. For example `-0430` refers to 4 hours 30 minutes behind UTC, and `04` refers to 4 hours ahead of UTC. The modified commands `%Ez` and `%Oz` parse a `:` between the hours and minutes and render leading zeroes on the hour field optional: `[+|-]h[h][:mm]`. For example `-04:30` refers to 4 hours 30 minutes behind UTC, and `4` refers to 4 hours ahead of UTC.
`%Z`	The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3.1) that are alphanumeric, or one of '`_`', '`/`', '`-`', or '`+`'.
`%%`	A `%` character is extracted.

30.14 Hash support [time.hash]

```
template<class Rep, class Period> struct hash<chrono::duration<Rep, Period>>;
```

1 The specialization `hash<chrono::duration<Rep, Period>>` is enabled (22.10.19) if and only if `hash<Rep>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<class Clock, class Duration> struct hash<chrono::time_point<Clock, Duration>>;
```

2 The specialization `hash<chrono::time_point<Clock, Duration>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::day>;
template<> struct hash<chrono::month>;
template<> struct hash<chrono::year>;
template<> struct hash<chrono::weekday>;
template<> struct hash<chrono::weekday_indexed>;
template<> struct hash<chrono::weekday_last>;
template<> struct hash<chrono::month_day>;
template<> struct hash<chrono::month_day_last>;
template<> struct hash<chrono::month_weekday>;
template<> struct hash<chrono::month_weekday_last>;
template<> struct hash<chrono::year_month>;
template<> struct hash<chrono::year_month_day>;
template<> struct hash<chrono::year_month_day_last>;
template<> struct hash<chrono::year_month_weekday>;
template<> struct hash<chrono::year_month_weekday_last>;
```

3 The specializations are enabled (22.10.19).

[*Note 1*: All the `hash<Key>` specializations listed above meet the *Cpp17Hash* requirements, even when called on objects `k` of type `Key` such that `k.ok()` is `false`. — *end note*]

©ISO/IEC 2018

```
template<class Duration, class TimeZonePtr>
  struct hash<chrono::zoned_time<Duration, TimeZonePtr>>;
```

4 The specialization `hash<chrono::zoned_time<Duration, TimeZonePtr>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled and `hash<TimeZonePtr>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::leap_second>;
```

5 The specialization is enabled (22.10.19).

30.15 Header <ctime> synopsis [ctime.syn]

```
#define __STDC_VERSION_TIME_H__ 202311L

#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below
#define TIME_MONOTONIC see below      // optional
#define TIME_ACTIVE see below         // optional
#define TIME_THREAD_ACTIVE see below  // optional

namespace std {
  using size_t = see 17.2.4;
  using clock_t = see below;
  using time_t = see below;

  struct timespec;
  struct tm;

  clock_t clock();
  double difftime(time_t time1, time_t time0);
  time_t mktime(tm* timeptr);
  time_t timegm(tm* timeptr);
  time_t time(time_t* timer);
  int timespec_get(timespec* ts, int base);
  int timespec_getres(timespec* ts, int base);
  tm* gmtime(const time_t* timer);
  tm* gmtime_r(const time_t* timer, tm* buf);
  tm* localtime(const time_t* timer);
  tm* localtime_r(const time_t* timer, tm* buf);
  size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

1 The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.[234]

2 The functions `gmtime` and `localtime` are not required to avoid data races (16.4.6.10).

See also: ISO/IEC 9899:2024, 7.29

234) `strftime` supports the C conversion specifiers `C`, `D`, `e`, `F`, `g`, `G`, `h`, `r`, `R`, `t`, `T`, `u`, `V`, and `z`, and the modifiers `E` and `O`.

©ISO/IEC 2019

31 Input/output library [input.output]

31.1 General [input.output.general]

1 This Clause describes components that C++ programs may use to perform input/output operations.

2 The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 135.

Table 135 — Input/output library summary [tab:iostreams.summary]

	Subclause	Header
31.2	Requirements	
31.3	Forward declarations	`<iosfwd>`
31.4	Standard iostream objects	`<iostream>`
31.5	Iostreams base classes	`<ios>`
31.6	Stream buffers	`<streambuf>`
31.7	Formatting and manipulators	`<istream>`, `<ostream>`, `<iomanip>`, `<print>`
31.8	String streams	`<sstream>`
31.9	Span-based streams	`<spanstream>`
31.10	File streams	`<fstream>`
31.11	Synchronized output streams	`<syncstream>`
31.12	File systems	`<filesystem>`
31.13	C library files	`<cstdio>`, `<cinttypes>`

31.2 Iostreams requirements [iostreams.requirements]

31.2.1 Imbue limitations [iostream.limits.imbue]

1 No function described in Clause 31 except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in Clause 31 or as an overriding virtual function of any class declared in Clause 31 calls `imbue`, the behavior is undefined.

31.2.2 Types [stream.types]

`using streamoff = `*implementation-defined*`;`

1 The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.[235]

`using streamsize = `*implementation-defined*`;`

2 The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.[236]

31.2.3 Positioning type limitations [iostreams.limits.pos]

1 The classes of Clause 31 with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.

2 [*Note 1*: For each of the specializations of `char_traits` defined in 27.2.4, `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`. — *end note*]

3 In the classes of Clause 31, a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character container types (3.10) that meet the requirements for a character on which any of the iostream components can be instantiated.

235) Typically `long long`.

236) Most places where `streamsize` is used would use `size_t` in C, or `ssize_t` in POSIX.

©ISO/IEC 2020

31.2.4 Thread safety [iostreams.threadsafety]

1 Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.10.2) unless otherwise specified (31.4).

[*Note 1*: Data races result in undefined behavior (6.10.2). — *end note*]

2 If one thread makes a library call a that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call b such that this does not result in a data race, then a's write synchronizes with b's read.

31.3 Forward declarations [iostream.forward]

31.3.1 Header <iosfwd> synopsis [iosfwd.syn]

```
namespace std {

  using streampos  = fpos<char_traits<char>::state_type>;
  using wstreampos = fpos<char_traits<wchar_t>::state_type>;
  using u8streampos = fpos<char_traits<char8_t>::state_type>;
  using u16streampos = fpos<char_traits<char16_t>::state_type>;
  using u32streampos = fpos<char_traits<char32_t>::state_type>;
}
```

©ISO/IEC 2022

1 Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.[237]

31.3.2 Overview [iostream.forward.overview]

1 The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

2 The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, `basic_syncbuf`, and `basic_spanbuf`.

3 The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream`, `basic_ifstream`, and `basic_ispanstream`.

4 The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, `basic_osyncstream`, and `basic_ospanstream`.

5 The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream`, `basic_fstream`, and `basic_spanstream`.

6 [*Note 1*: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (27.2). — *end note*]

7 Other *typedef-name*s designate class template specializations for `char` or `wchar_t` types.

8 Specializations of the class template `fpos` are used for specifying file position information.

[*Example 1*: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — *end example*]

9 [*Note 2*: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — *end note*]

31.4 Standard iostream objects [iostream.objects]

31.4.1 Header `<iostream>` synopsis [iostream.syn]

```
#include <ios>          // see 31.5.1
#include <streambuf>    // see 31.6.1
#include <istream>      // see 31.7.1
#include <ostream>      // see 31.7.2

namespace std {
  extern istream cin;
  extern ostream cout;
  extern ostream cerr;
  extern ostream clog;

  extern wistream wcin;
  extern wostream wcout;
  extern wostream wcerr;
  extern wostream wclog;
}
```

31.4.2 Overview [iostream.objects.overview]

1 In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).

2 The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects. The dynamic types of the stream buffers initially associated with these objects are unspecified, but they have the behavior specified for `std::basic_filebuf<char>` or `std::basic_filebuf<wchar_t>`.

3 The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.10.3.1) begins execution. The objects are not destroyed during program execution.[238]

237) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

238) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

©ISO/IEC 2023

4 *Recommended practice*: If it is possible for them to do so, implementations should initialize the objects earlier than required.

5 The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.10.3.3).

[*Note 1*: As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects. — *end note*]

6 Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILE`s, as specified in the C standard library.

7 Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.10.2).

[*Note 2*: Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — *end note*]

See also: ISO/IEC 9899:2024, 7.23.2

31.4.3 Narrow stream objects [narrow.stream.objects]

`istream cin;`

1 The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2 After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

3 The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

4 The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

5 After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

6 The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

31.4.4 Wide stream objects [wide.stream.objects]

`wistream wcin;`

1 The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

2 After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

3 The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`wostream wcerr;`

4 The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

©ISO/IEC 2024

5 After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

```
wostream wclog;
```

6 The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

31.5 Iostreams base classes [iostreams.base]

31.5.1 Header <ios> synopsis [ios.syn]

```
#include <iosfwd>    // see 31.3.1

namespace std {

    locale getloc() const;

    // 31.5.2.6, storage
    static int xalloc();
    long&  iword(int idx);
    void*& pword(int idx);

    // destructor
    virtual ~ios_base();

    // 31.5.2.7, callbacks
    enum event { erase_event, imbue_event, copyfmt_event };
    using event_callback = void (*)(event, ios_base&, int idx);
    void register_callback(event_callback fn, int idx);

    ios_base(const ios_base&) = delete;
    ios_base& operator=(const ios_base&) = delete;

    static bool sync_with_stdio(bool sync = true);

  protected:
    ios_base();

  private:
    static int index;          // exposition only
    long*  iarray;             // exposition only
    void** parray;             // exposition only
  };
}
```

1 `ios_base` defines several member types:

(1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;

(1.2) — a class `Init`;

(1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;

(1.4) — an enumerated type, `seekdir`.

2 It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

3 [*Note 1*: For the sake of exposition, the maintained data is presented here as:

(3.1) — `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

©ISO/IEC 2027

(3.2) — `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;

(3.3) — `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

— *end note*]
